> It is like RF inductive and capacitive REACTANCE.
> 73 "Ollie"
> k0lqk
>
Hi Ollie,

I did use a communications testset of Rohde&Schwarz (CMT).
It was giving a signal on 145Mc , 1Kc tone with a deviation of 3Kc.
Then I found at the 1200bd audio out about 200mV (open circuit).
And when I did terminate the 1200bd audio out with a 5k7 resistor I
found about 100mV.
Sinds the outputimpedance of the OPAMP is relativly low and there are
2 resistors in series (4k7 + 1K) at the output of this OPAMP
(according diagram), I think that I did it right.
Do I mis somthing?

Have similar issue with MD-200 mic.

Solution is to crank up mic-gain to 65-80%.
Remember-- with a hand-mic, you hold the element
only about 1 inch from your face. With a desk mic
you're sitting 6 inches away-- a big difference!

My MD-200 works great now!

The microphone is quite what? Quite big? Quite nice? Quite ugly? Or, did you mean it is QUIET, as in LOW AUDIO LEVEL? If audio level is the case, adjust the USER MENU, microphone gain for the proper MODE affected. Do NOT access the "Hidden" ALIGNMENT menu without first connecting a precise 13.8 volt power source to the radio, or you may (may have already) corrupt the factory alignment settings! The 13.8 volts is used as a REFERENCE voltage! --Good luck & 73, KC3VO Bob Curry

20073. FM Mode Help ?

Yahoo group: FT897 (2007)
Date: 2007-09-08 11:10:06 UTC
From: Scott
Topic: 20073 Message: 20073

Hi All,

When I'm in the FM mode I can't hear background noise at all, it's like the squelch is all the way up or the sound is off.

I have turned the squelch all the way off but I still can't hear any background noise at all.

I feel that I have a setting in the FT-897 not set right.

I don't have this problem in HF bands.

Can anyone help please ?

Thanks Scott

From: James Wilson
Topic: 20073 Message: 20074

Look up tone squelch in the manual. Basically the radio doesn't open squelch unless it hears a specific tone. Most of the time this should be turned off.

I am in search of MARS/TX expansion for a very new model FT-857D. My hardware (jumpers) does not have the same configuration as that shown in mod diagram as my jumper # 1006 has no bridge, where the mod manual says it should have one and be left that way; and, if you have tried the soft jump mod with a CAT cable, with everything linked and working properly, the current eeprompt configuration should show 1D 06 before attempting to write the new configuration. For some strange reason mine reads 1F 06, and when I□ ve tried the mod using the same program, it shows that it isn□t accepting. Have you seen this problem or have any solution or lead which might enable me to do either mod myself. A retailer will do the mod for $40, but the only reason I want to do it is to prove to myself I can. Please advise at your convenience and thanks for your reply.

Best regards,

Jeff-KD6NBD

Jumping #1006 gives the FT-897 the new 60 meter ham band (as well as the MARS frequencies in that region).

I've not messed with the CAT method, as I heard that it didn't work on the newer models.

Forty dollars sounds like a good deal to me. I did my own and several others for MARS members, but I have a Hako Desoldering tool. If the retailer will do the mod, let him . It is money well spent. If you pull up one of the pads that need to be jumped, Yaesu will charge you $800 to replace the board!

20085. Re: Possible fix for J-7 problem - 897D

Yahoo group: FT897 (2007)
Date: 2007-09-09 15:13:00 UTC
From: Jerry
Topic: 19882 Message: 20085

Jeff,

This what my 897D looks like. Did yours look similar?

Back

O 1007
O 1008
O 1009
O 1004
O 1005
O 1006
X 1001
X 1002
O 1003

Front

X - jumper installed
O - open

The mods I found (from KB2LJJ)have it looking like this after the
mods:

Back

X 1007
X 1008
X 1009
O 1004
O 1005
X 1006
O 1001
O 1002
O 1003

Front

X - jumper installed
O - open

One of the recent posts says that J1006 is for 60M, so I think mine
is OK being left empty as I already have 60M. When I looked at the
paper from Yaesu, I couldn't decipher what mine was setup for. Does
anyone have an idea what J1001 and J1002 do?

Sorry for being so long winded. I'd like to open up the MARS/CAPS
frequencies, but REALLY want to have an idea why I'm removing/adding

jumpers.

BTW - mine doesn't work with WideBander either. The radio is too new.

Thanks,

Jerry K8CMI

20086. Re: [FT897] Memory Channels 601-605 Question

Yahoo group: FT897 (2007)
Date: 2007-09-09 15:54:42 UTC
From: David Shaw
Topic: 20084 Message: 20086

Page 45

Frequency data stored on a memory channel can be deleted,
if desired, from any memory channel except channel "1."
The deletion process is not a "hard" erasure, so if you erase
a channel by mistake using this procedure, the memory chan-
nel contents can be recovered.
1. Press the [F] key momentarily, then rotate the MEM/
VFO CH knob, as needed, until Multi Function Row
"b" [MW, SKIP, TAG] appears on the display.
2. Press the [A](MW) key momentarily, then rotate the
MEM/VFO CH knob to select the memory channel to
be deleted.
3. Press the [B](MCLR) key momentarily. The frequency
display field on the LCD will go blank, and the memory
channel number will blink.
4. Wait about five seconds; when the memory channel num-
ber stops blinking, the data will now be "masked" and
will not be available for operation.
5. To restore the masked frequency data, repeat the above
steps. However, if you store new frequency information
on a channel containing masked data, the masked data
will be over-written and lost.
6. Memory Channel 1 is used for Priority operation, and
frequency information may only be over-written (not
masked) on this channel.

20088. An overall impression / review of the FT-897

Yahoo group: FT897 (2007)
Date: 2007-09-09 18:05:55 UTC
From: Buckskinner38
Topic: 20088 Message: 20088

Hi folks,
I've joined this group to get an idea of how this radio performs in the real world. I am looking for honest opinions and not first impressions on how this rig performs. I want to know what types of tricks it can do and its capabilities.

I am trading/selling off an FT-736R to upgrade to an ALL MODE/Band radio and the FT-897 seems to have what I want.

What I want is a smaller rig that can continuously cover all shortwave bands and UHF and VHF... Let's face it, I like talking to you guys but sometimes I just want to listen to music. I also like the Idea of packing up my station and taking it with me to go camping or to use it on field day.

I am also an owner of a VX-7R and I like that rig: I think it would be a nice match to the FT-897....
Anyway, I would appreciate you comments

20089. New 897D Deaf as a post?

Yahoo group: FT897 (2007)
Date: 2007-09-09 01:58:39 UTC
From: roger_h_sale
Topic: 20089 Message: 20089

OK gentlemen so here it is, I have had a new ft897D a few weeks, and mostly used VHF/UHF which is fine, as yet no HF antenna so just tuning around on receive with a long wire, but here is the problem, compared to my Ft817ND its deaf as a post, even to commercial stations at night where I can hear things easily on the 817, before I go running back to the shop has anyone suggestions? I use the squelch as a squelch and not RF gain, but I'm wondering if I have a menu set wrong. Attenuator is off and AGC is slow, and I'm out of ideas.
Thanks in advance,
Roger M3UOU

Jim I had sam problem.
I have a 100 Ft. long wire.
I put a 100uf cap. between tuner and antenna.
I then tuned all band centers from lowest to highest.
from 6m,10m,12m,15m,17m,20m,30m,40m,60m,75/80m,160m to set pretune.
I tryed jumping around bands but got hswr warnings.
Must be done in order to work best.
I have good results now.

20091. RE: [FT897] An overall impression / review of the FT-897

Yahoo group: FT897 (2007)
Date: 2007-09-09 21:42:59 UTC
From: Ken Bandy
Topic: 20088 Message: 20091

JD, the FT-897D was my first Yaesu rig. I bought mine new in the summer of '05. A month or two after I received it, the VFO started acting funny, turned out the big knob had a problem with the optical encoder on it. After being without the rig for right at 4 weeks, it was returned to me repaired, and has been fine ever since. I use an ICOM 756 Pro-III at a club/contest station occasionally, and of course, it is a nicer rig, has a few more features, but then it costs better than 2x's what the 897 does. I have logged lots of contacts on my 897 barefoot, and with modest antennae. It's fairly user friendly, and makes a great digital rig, if you're interested in that. I liked my 897D so well that I bought a used 897 (non-D) for portable ops.

A word of caution: don't get the FC-30 tuner. I did, and found it to be a pretty picky unit. Get the LDG AT-897, it bolts on just like the FC-30, and is a lot more forgiving. Also, I would recommend getting the LDG FT-meter. A very worthwhile investment.

73,
Ken

-Hello JD
I have a elecraft k2, Kenwood TS 480 (mobile) Icom 746 and Have had
a Kenwood TS-570S..
The FT 897D I have had for over a Year. I have Found the DSP on the
RX side for SSB is Fine. So I use the two filter slots for CW one 500
hz and one 300 hz collins filters. I have used the 897D for SSB 2
meters and CW on two meters, works very well. For the Price of the
Radio it is very hard to beat.
I like it better than the TS 570S and TS 480 on SSB HF Receive.
and of course it covers 144 and 440 whitch works very well.

I have had this radio for 9 months. I like this radio for the portability. I have used it portable just above Mt Whitney Portals. I ran the radio on the batteries. I bought one for that purpose. I only got one battery when I did. I didn't want to get both batteries up front. I wanted to put some use on the radio and the battery for about a year before I bought the second one (battery).

I read an earlier response that recommended that you get the AT-897 and the FT Meter. Both very good choices. I use the FT meter here in the house when I am operating on the G5RV antenna and the VHF/UHF antenna. That is a great setup.

I am also using a desk mike with mine. I modded a D-104 with a Heil element and that works great for HF pile ups. But, the local folks here report that I sound great with the stock mic.

Feed it with a good power supply. You'll enjoy the radio I think.

Hi Perry,
Checked menu # 80 with both RF and Squelch settings but no joy, for example, (adjusted both for max gain) I put a miracle ducker on the 817 and found a DX contest station easily, I quickly swapped it on to the 897 and heard nothing, even at night I struggle to hear a commercial station on the 897d, I wonder if the 817 was designed to have a more sensitive receive?

Subject: Re: [FT897] Re: New 897D Deaf as a post?

Hi Perry,
Checked menu # 80 with both RF and Squelch settings but no joy, for example, (adjusted both for max gain) I put a miracle ducker on the 817 and found a DX contest station easily, I quickly swapped it on to the 897 and heard nothing, even at night I struggle to hear a commercial station on the 897d, I wonder if the 817 was designed to have a more sensitive receive?

Hi Michel,
Unlike the 817, the 897 has only one option as far as I'm aware for HF antenna. The other N type socket is for vhf/uhf.

From: martin_ehrenfried
Topic: 20101 Message: 20101

Hi All,

I have just posted a new document in the files section.

This gives detail of my investigation into the mystery of the FT-897D audio processing function, ALC operation and how to get the best transmit audio from your radio.

I hope you find it useful and enjoy reading it.

Martin, G8JNJ

20104. 2m Transmit sticking?

Yahoo group: FT897 (2007)
Date: 2007-09-10 19:15:05 UTC
From: Lloyd Mitchell
Topic: 20104 Message: 20104

Anyone had trouble with the FT897 sticking in transmit?

I have a 70 foot run from the shack to the 35 ft tower with a ARX-2b on top. Every now and again the FT897 sticks in transmit while using the radio on 2 meter FM.

I can double clutch the PTT and it'll release. The PTT button is not sticking on the radio, and it works just FB on SSB on the lower bands.

Lloyd KO4L

20105. Re: [FT897] 2m Transmit sticking?

From: Charles Scott
Topic: 20104 Message: 20105

Lloyd:
Sticking in transmit is often an indication of RF getting into the microphone or PTT inputs. It makes sense that this doesn't happen in SSB mode since there's not much RF transmitted when you're not saying anything.
It's interesting that you say "double clutch"ing it will release it, though, since that sounds more like a mechanical problem. You don't happen to have VOX or any such thing on for some reason, do you? Could just be that as you move the mic when you "double clutch" that the RF changes just enough to let it drop. Also, with the ARX-2B outside on a tower there shouldn't be that much RF near the radio, unless it's up a couple stories and in the near field of the antenna. Are you running an amplifier also? If it is RF then an RF choke on the mic lead at the radio or an RF choke on other inputs to the radio may fix that problem. It's also been suggested for the stock 897 mics to open the mic and loop the cable connector through a small toroid to help reduce RF into the mic. This may also clear up distortion problem caused by RF getting into things.

Congratulations on your excellent document. You have obviously put a lot of effort into producing this paper. I RECOMMEND it as excellent reading for all FT897 (and other) SSB operators. I am using an electret capsual in the MH-31 microphone and still get reports of poor audio quality (compared to other transceivers) from local operators. I will set up as per your suggestions and see what results I get. One again - THANKS.

The problem is RF based... I put a couple of clip-on ferrites and that stopped it.

Amazing but I also noticed that when transmitting on 2m, the computer speakers have just a little hum. didnt get that on the Icom 228H. nothing changed except connected the coax to the 897.

I also have the MH-59abj full dtmf mic. I have not tried it yet, but I'll bet its gonna be a problem too

The antenna is on top of the tower approx 50 ft from the shack then up 25 ft The shack is a metal skin building BUT I have a clear shot to the antenna thru the window right to the radio. No amp (never needed one)

thanks for the help.

> ground rod
> just outside.

A DC ground to a ground-level ground rod can be useless at RF. Back in 1976 when I was on Sable Island, I had a second floor ham shack and I tried to run a wire straight down from my window to a ground rod. It worked fairly well on 160, modestly well on 80, somewhat on 40, was useless on 20m, so-so on 15m and tolerable on 10.

Now, you may ask, why?

Because the distance to the ground rod was just about a quarter wave on 20m. This rendered the connection useless at RF on that band. And the interference to poorly-shielded stereos in the building was terrible. I ended up putting a ground-mounted vertical out 250 feet from the house. No more problems.

OK Guys thanks,
I've been looking at a 897 rig with the Yaesu Tunner, 2 Batteries, and te rapid charger. It a trade in at our local candy store. But so is my rig.

I'm looking at getting a DTMF Mike in addition as well as the power supply. I've been checking the mods and was wondering if anyones done ESSB or Hi-Fi SSB with the 897?

Also, how hard was it to wire in another mic?

Computer speakers are notorious. My speakers can pick up my cell phone at 10 feet sometimes. I'm a bit fortunate in that this stucco building has mesh in the walls, which keeps most of the RF outside.

Wiring the mic was easy. I ended up using a pre made CAT 5 cable. I just cut it off for the length of cable I needed for the mic and used the pin out in the manual.

20114. New 897D

Yahoo group: FT897 (2007)
Date: 2007-09-12 12:22:25 UTC
From: scott
Topic: 20114 Message: 20114

Hi to the group, I finally pulled out the plastic and ordered a new FT- 897D, it should be here tomorrow. I currently own a FT-817 ND and think it is a great radio, but sometimes want a bit more power portable,(20 watts should be just right), especially in such poor band conditions. I hope it is going to be as reliable as my 817 has been. I've downloaded the manual and it seems very similar to the 817's way of doing things, which I find to be easy to use, more logical to my brain than Icom's system of menus. I would welcome any tips or suggestions on it's use. cheers, scott. kg6brg.

20115. Re: New 897's now with good bias aligmnents out of the box?

Yahoo group: FT897 (2007)
Date: 2007-09-12 12:29:36 UTC
From: dj5hd
Topic: 19700 Message: 20115

We have checked and adjusted 4 of our FT-987 in our local group, here
are the results (all in mA):

S/N Pre-Driver(35) Driver(30) Exiter(2x100) Driver_HF(300)
Driver_V/UHF(300)
30130212 50 69 100 132 295
2N070065 35 27 180 357 300
51560001 33 56 92 88 270
4D280008 28 55 89 88 275

All units exept one, which obviously was already adjusted before had
bad idle currents.
The S/N 51560001 was the one, that produced a lot of out of band noise
during our dxpedition. The idle currents of the exciter and finals
were way too low. We will see how this TRX behaves on our upcoming
trip to PJ7 in November.

Hello Donald,
The manual is not very clear about this, but
that menu option is for an external meter.
A 1mA meter can be plugged in, just under
the front panel, a 3.5 mm jack.

Dear Ken

If an LDG FT Meter is plugged in and the menu is set for SWR, does this menu item ONLY affect the LDG meter or does it also affect the meter on the 897 display? Would be nice to monitor SWR on one meter and ALC on the 897 display.

Go on menu "i" (short press on FUNC) and on "B" you
can select ALC, PWR, MOD or SWR.

20120. Power output question

Yahoo group: FT897 (2007)
Date: 2007-09-12 19:03:34 UTC
From: Sholto Fisher
Topic: 20120 Message: 20120

My FT-897D seems to produce less power out than the menu setting displays.
Is this normal for these rigs?

At 10W setting the rig's output is around 8W.
At 20W setting it's only 15W.
At 30W it's barely 20W.

All of these tests were in CW mode into a dummy load.

I guess my external ATU (Kenwood AT-180) could be misreading but
historically it's always been accurate.

Anybody else care to take a measurement and report back?

73 Sholto KE7HPV.

Hello Dan,
So far as I know [beacause I don't use an
external meter] the setting for the external
meter has no effect on the front panel display.
But as Nastase has just said, you can set the
display by the quick menu "i" to read what
you require, independant of the external meter.

From: Mark Vaughan
Topic: 20120 Message: 20124

You aren☐t looking at a massive error here, think of it in dB, not watts.

It is quite possible that Yaesu have the settings a little off, they struggle to get many of them right, they are adjustable in the hidden menus.

It is also possible your meter is a little out, very very rarely will you find a meter that is linear across it☐s whole range of power and frequency, and when you do it normally has a £1000 + price tag, so despite the fact you seem to trust your meter, it may be a little out. Glad to see you☐ve at least put a dummy load on, these questions normally come from people with it hooked to a rough antenna.

Also look to your DC supply to the radio, I don☐t think the power section has any regulation for voltage fluctuations, It☐s a long time since I☐ve done any accurate power checks on my 857 to remember, it stays bolted in the car, but I do know if I take it out on batteries, the RF power falls off as the battery voltage falls off. Could simply be you power supply, or bad DC connection?

20125. HM-59A8J hand microphone

Yahoo group: FT897 (2007)
Date: 2007-09-12 22:38:00 UTC
From: Richard Arland, W3OSS
Topic: 20125 Message: 20125

After much head scratching and with $60 burning a hole in my pocket, I finally ordered a HM-59A8J hand mic for my FT-897 from Universal Radio (these guys and gals are great, in the event you've never purchased from Universal before).

I remember seeing several threads on this list regarding the HM-59A8J mic and its apparent problems. Can anyone direct me to a synopsis of the problems with this mic and proposed corrective measures?

Also, I am a big proponent of using Heil mic cartridges in place of stock mic elements. Has anyone tried using a Heil AC-4 (DX audio) and/or an AC-5 (general ragchewing audio) mic element in the HM-59? If so, what were your results?

Any and all help would be greatly appreciated. Many thanks in advance.

73 Rich W3OSS

First off, disassemble, carefully pull the electret cartridge out of it's holder and remove the plastic plate blocking it's exposure to direct audio. Re-assemble..

This will make a large difference in the audio quality.

Also try to keep Mic gain around 20

One other issue is RF getting into the mic. The correction involves
installing a small toroid core inside the Mic Shell with the cord wrapped
around it. If you are interested email me and I will send you the doc.

20128. Re:SHACK UPSTAIRS

Yahoo group: FT897 (2007)
Date: 2007-09-12 23:54:22 UTC
From: KA6UUP
Topic: 20048 Message: 20128

I also have a second story shack.
I read this in a ham magazine a few years ago and it works.
First put a ground rod right below your shack location. As close as possible.
Get a piece of RG-8 (or equivalent) long enough to reach the ground rod right below your shack.
At both ends strip back enough to solder a .01 mf cap (I use a disk cap) between the
jacket at BOTH ends. This makes the coax non-resonant at any frequency.
Clamp one end to the ground rod and water proof the connection.
Run the cable through the wall or a window etc. and hook it to a ground buss and ground everything to that buss.
I have been using mine for 20 years with no problems.
Good Luck
73,
Chuck KA6UUP

I don't quite see what a 0.01uF capacitor will do that just shorting the inner to outer won't do. After all a 0.01uF will look pretty much like a short at HF frequencies.

Hello Chuck,
Your length of coax [which you are really
using as a thick wire] will still be a resonant
length on some frequencies. You may have
been lucky in that the length you are using
is causing no problems on the bands you use.
Also, even when a ground lead is resonant at
quarter wave or multiple it can still happen that
the set up works. Many aerials do not require
a ground connection to operate.

From: K.Greenough
Topic: 20048 Message: 20133

Further comments on long ground leads.
A simple "tuner" which can consist of a
variable capacitor or variable coil [switch
between them] can make the ground lead
look like a half wave or multiple of half wave
and therefore give as good a ground as the
actual ground connection, ignoring the DC
resistance of the lead which should obviously
be kept low. This will stop the transmitter from
being "hot" with RF. But it should be realised
that the ground lead will radiate and at the quarter
wave point along it will have a high RF voltage
present. So it needs to be where it can't be
touched. The radiation from a ground lead fastened
to a wall will likely be poor, but if the actual aerial is
a half wave of wire then half of the transmitter power
will be to the ground lead. So it can waste considerable
power.

From: bigiantrike
Topic: 20064 Message: 20135

UPDATE
I have gotten to the bottom of the quite audio on FM with my MD-100. I opened the head of the mic...this was a major operation as it was bonded...not sure if they are all bonded from new or if someone has done it as an after thought...lol.. I ended up putting the mic head in my lathe after wrapping it in self amalag to stop the damage and used a Stanley knife in the groove whilst spinning the head in the chuck.
Once the head cover was off it became obvious that there ate 2 mic inserts in the head. 1 right at the front just behind the front grill and one set into the back to pick up the sound from the side vents. On inspection it appeared that the rear one was not connected..with a little soldering the audio was back up to were it should have been in the first place....
As my mic was acquired second hand I can not be sure if it was disconnected by the previous owner or whether it was like that when it left the factory.. If some brave sole would like to remove there head and have a look if it came as standard disconnected..

Seeing as these Mic's are made in china they may use the same head for a Karaoke machine coming out of the same factory and utilizing the same mic....lol

There may be another option. I'm taking a General class through my club (Wide Area Amateur Radio Network) and tonight our teacher explained an alternative. Use three separate ground straps to the same ground rod. Each one should be a different length. That way if one ground strap is resonant on your frequency, instead feeding RF back into the shack one of the other straps should short it to ground.

It may be Old School, but it sounds cheaper than buying an artificial ground. My shack-to-be is two and a half floors off the ground. I had been thinking about a device, too. But this sounds just as effective, if maybe less pretty.

Good luck.

Hello Pete,
The snag with that approach [3 different length
leads] is that for it to work the difference in length
needs to be a large fraction of the wavelength of
the band you wish to use. If you want to use 80m
for example you need at least 50 ft or so to change
from a quarter wave. As you go higher the lengths
get shorter but even at 10m you need a difference
of about 8 ft.
An tuning unit for the ground lead can be made very
easily and cheaply. You need a variable capacitor
say 500 pF. A 12 way switch [can be less but the
more ways, the better adjustment], a coil with 11 taps,
a box to put it in and a toggle switch .
You then wire the capacitor in series with your ground
lead and put a toggle switch [or any other type] across
the cap' . You can now switch it in / out of circuit.
Then wire the coil in series as well and have the multi
position switch short out to the various taps. Have the
last position so that it shorts the coil altogether.
That's it. If you are using a SWR meter you can adjust
for best match, but ideally you put a torroid over your earth
lead with a few turns of wire on the torroid. These feed
a diode and meter and you adjust for maximum ground
current, which is what the meter will read.

Hello Cincinnatti,
Your ATU is causing the bad match on 2 and 70
when you have it in line. It's circuitry is just not
suited to vhf and uhf.
If you get a good match with your vhf / uhf aerial
direct then there is no need for an ATU.

From: Brandon Cruz
Topic: 20139 Message: 20143

Jean-Christophe, the internal and external meters can indeed be different. Setup menus 60 and 61 are used to set the mode for the external meter while the internal meter is controlled by the A-B-C menu settings. My 897D isn't in front of me right now so I don't recall which letter menu is used for the internal meter mode but if you cycle through those menus you'll see it,

As an example I often leave the internal meter set for power output and the external meter for SWR (or vice-versa). It's nice to have both displayed simultaneously.

f5alj <f5alj@...> wrote:
Hi All,

I just bought my FT-897D rig and a LDG External FT-Meter, and I did'nt
found how to have Modulation display on internal LCD and Power Display
on external LDG FT-Meter display for Tx Operation.

Does that mean that it is not possible to separate internal and
external display type ?

Thanks for reading,

20144. HRD access to FT-897 Memory Chan vs VFO

Yahoo group: FT897 (2007)
Date: 2007-09-13 18:26:24 UTC
From: aultox
Topic: 20144 Message: 20144

I'm trying to use Ham Radio Deluxe (HRD) with my FT-897 in a mode that selects a stored Memory channel containing a VHF repeater frequency with it's offset and Tone Encoding.

A. Can't find any HRD commands that will select by Memory Channel.

B. When setting up the FT-897 for a Repeater Chan w/offset and tone, and using the Quick/Store, HRD stores the Repeater Frequency as a VFO selection without the Tones needed for Repeater access.

Is there any way to set up for easy retrieval a small number of Repeater channels or any access to the FT-897 memory channels?

thanks,

ed

Topic: 20048 Message: 20149

Guys:
At the risk of offending some, I just have to say (as I believe I have in the past) that there is no such thing as an RF ground. All terminations, unless restricted to a very small space, have reactance at RF. It doesn't matter what you do with them, whether that be an artificial ground, multiple ground lines, capacitors on cables, there's reactance. Also, unless your ground behaves just like a transmission line at all frequencies (not sure how you'd achieve that), there will be standing waves on it and potentially voltage and current nodes. Also, while you may reduce the effect of RF at the radio, such as distortion in transmit signal, hot chassis, functional problems, you're likely passing that off to somewhere else along your ground line. Whether that affects anything or not is pure chance.
Also, the fact that you have an RF problem at your radio is a result of one of two things or a combination of them. One is that your radio is actually part of the antenna system, which indicates that your transmission line is not sufficiently decoupled from the antenna or there's a feed imbalance. The other is that you're wiring around the radio is in the antenna's near field and is picking up energy. Both of these situations should be dealt with accordingly rather than masked with RF grounding Voodoo.
None of this is meant to say that most outdoor antenna installations still need a lightning ground, so don't be putting those words in my mouth.
I realize this goes against much of Ham lore, but I hope not too many of you are offended. :)

20150. Re: Internal Short

Yahoo group: FT897 (2007)
Date: 2007-09-14 13:55:18 UTC
From: Ask me.....
Topic: 20025 Message: 20150

I have seen this situation as well. I believe the power supply (Jetstream switching 14 A) in my case sees the rig as am initial short and trips the supply out. I can run my IC-207 without any problems or my FT-817. The power supply is the culprit not your '897. I may add a bunch of capacitance at the output terminals to act as a "reserve" when the rig is first switched on.

Hi Don,

Just got around to checking the currents on my recent FT-897D

S/N Pre-Driver(35) Driver(30) Exiter(2x100) Driver_HF(300)
Driver_V/UHF(300)

6J74XXXX 31 58 80 765 760 - now set to 40 50 204 300 300

As you can see a big variation from the correct values, especially
the Exciter and PA. In fact the PA currents were so high, I wondered
if Yaesu were now setting them to 800mA to improve linearity?

20152. Portable Rig Dilemma

Yahoo group: FT897 (2007)
Date: 2007-09-13 16:36:57 UTC
From: John Z
Topic: 20152 Message: 20152

I'm attempting to re-energize my hamming by doing portable operation out of our travel trailer - I've never done anything like this before. I'm selling my older, larger base station to get a new portable rig. The contenders are the FT-897 and the Icom IC-7000.

The FT-897 seems ideal for portable work, with the ability to put an AC supply inside the unit, or the batteries - this should work well at RV campsites whther there is AC hookup or not.

My dilemma is that the IC-7000 is very seductive with its color screen, filtering features, and smaller footprint. But it also would need external power supplies which would tend to make it more bulky as compared to the FT-897.

So, I guess what I am asking, for those of you who have used both units, how you would compare the two for portable operation out of an RV.

Thanks!

John

I have set up my FT897D up as you suggest. Local operators say that the TX audio has improved.

SETTINGS - I have the SSB mic gain at "12" (Am using a electret mic).
The internal processor* is "on" and the level is "15".
*With the processor off report is it sounds more "bassy". With it on gives better communications sound.

So my results are exactly as you found. The only problem I seem to have is the mic gain setting gives a different result to what you found. The ALC jumps to about 7 segments occasionally otherwise displays no segments. Cannot get it to "average peak" at about your suggested 3. Might be my chirpy Ausssie accent!

Good stuff.

Thanks for the info martin. I am sure that you noted that the PA is very different then the "Older Ones" caused by the necessary redesign of the VHF/UHF part. This was came to pass when Mitsubishi stopping production of the 2SC3102 power transistor.

First let me say that we have not received any information from YAESU that the Bias for the HF PA's has been changed from the Service Manual value of 300 mA. With the 800 mA you measured they are running almost Class "A"

Some sounds coming out of the back room are that the Land Mobil and Marine Radio Divisions are doing so well that YAESU production and engineering are taxed to the limit plus XX%. Ham Radio stuff may be being sub contracted "Out of House" which is always associated with some QC problems. My suggestion for the Buyer, until the problem goes away, is ask the Dealer (Seller) to check and if necessary adjust the bias. If he can't or won't do this it's the Buyers Choice.

Your ALC paper should be required reading. A very fine Job.

20157. Modulation Interference Help ?

Yahoo group: FT897 (2007)
Date: 2007-09-15 09:39:59 UTC
From: Scott
Topic: 20157 Message: 20157

I seem to be receiving some off frequency modulation interference on the FM band around 144- 155 MHZ on the FT-897D

I just installed a Hustler G6-270R Antenna.

I did not install a ground & rod because I did not see it in the instructions sheet ☐ should I have installed a ground wire & rod?

Or is there a filter setting or a add on filter I can install to prevent this interference from happening?

Thanks for any hints or help you can give me

Scott

Hi Dave,

Pleased you got good results.

I think it's quite hard to maintain speech within the 'sweet spot'
for ALC action. I suspect the first four bars are only meant to
indicate the onset of ALC, as they only have about 1dB range of
operation. Hitting 7 on occasional peaks seems about right, as you
say a lot depends upon your voice and its peak to average ratio
(crest factor).

But as you already know, it's easy for us 'whinging poms' to maintain
a consistantly high level of whining ;-)

Take care,

Martin - G8JNJ

Hi Don,

OK thanks for this.

I would also be interested to know if Yaesu have increased the PA bias from 300mA. As you say 800mA is aproaching class A operation, but the 2 tone IMD still looked fairly bad at full output, even with this level of bias current.

Also - have you ever noticed poor noise floor on SSB TX, my radio has three spurs at about -35dB WRT a single tone at full output. I think it's clock noise from the DSP, but you can hear them warbling away quite clearly in the background on another receiver, when I'm not speaking, or with the mic gain turned to zero. Is this usual ?

Hello Martin,
Long time no hear, hope you're well.
I've tried to send details of a mod and pic's
of the results, to remove most of the noise
on Tx. The details are available from mods
dk . My mail to you bounced. If you want the
details direct email me.

Topic: 20152 Message: 20162

John,

In the RV, I always have the trailer's batteries, so the built in AC on the FT-897 doesn't matter...

UNTIL you decide this whole portable thing is great and want to get on the air someplace else. The FT-897 (mine has the internal AC plus the AT-897 tuner from LDG) can be slapped on a picnic table, plugged in, connected to an antenna, and you're on the air. For me, that was the decision point, and I'm pretty glad I went this way.

If I was an HF backpacker, I'd go a different direction. Good luck on your decision.

Well I would go with the FT-897 or the FT-857D for the Trailer. I have both the FT-957D and the FT-897D and the ATAS-120 antenna. So I would also asked what about an antenna.

I would look at the FT-857D and use it with the trailer and the truck using a ATAS-120. Quick mount for the FT-857 and have fun in the truck and the trailer.

Subject: [FT897] Re: New mic a bit quite

UPDATE
I have gotten to the bottom of the quite audio on FM with my MD-100. I opened the head of the mic...this was a major operation as it was bonded...not sure if they are all bonded from new or if someone has done it as an after thought...lol.. I ended up putting the mic head in my lathe after wrapping it in self amalag to stop the damage and used a Stanley knife in the groove whilst spinning the head in the chuck.
Once the head cover was off it became obvious that there ate 2 mic inserts in the head. 1 right at the front just behind the front grill and one set into the back to pick up the sound from the side vents.
On inspection it appeared that the rear one was not connected..with a little soldering the audio was back up to were it should have been in the first place....
As my mic was acquired second hand I can not be sure if it was disconnected by the previous owner or whether it was like that when it left the factory.. If some brave sole would like to remove there head and have a look if it came as standard disconnected..

Seeing as these Mic's are made in china they may use the same head for a Karaoke machine coming out of the same factory and utilizing the same mic....lol

20170. RigBlaster Pro and Heil Mic

Yahoo group: FT897 (2007)
Date: 2007-09-16 17:18:32 UTC
From: azranger58
Topic: 20170 Message: 20170

Does anyone know the jumpering for the RigBlaster Pro when using a Heil mic?

I used the jumpering diagram in the RigBlaster manual for the Yaesu modular mic jack. Digital work and voice seemed to work fine until someone told me my voice is extremely distorted and unable to copy. I disconnected the RigBlaster, plugged the mic directly into the FT897, and then I was "loud and clear".

The RigBlaster manual states, "If you have a problem with the mic, make sure you used the jumper diagram that matches your mic, NOT necessarily your radio." What does that mean? I have no idea what jumpers match a Heil mic. Thanks, Lee KB9PIP.

Only one problem with the standard Ceramic SSB filter, if you are working SSB you may find that strong stations 5Khz up will blow by the filter. I have this problem on 6 m. On 6 m , sometimes propagation is so good that 1000 miles away a SSB sig up 5 will be 20 or more over s-9 will still get in.

-Hello JD
I have a elecraft k2, Kenwood TS 480 (mobile) Icom 746 and Have had
a Kenwood TS-570S..
The FT 897D I have had for over a Year. I have Found the DSP on the
RX side for SSB is Fine. So I use the two filter slots for CW one 500
hz and one 300 hz collins filters. I have used the 897D for SSB 2
meters and CW on two meters, works very well. For the Price of the
Radio it is very hard to beat.
I like it better than the TS 570S and TS 480 on SSB HF Receive.
and of course it covers 144 and 440 whitch works very well.

The all-band mod removes those memory channels. I all-banded my radio to get to 140Mhz for satcoms and lost those memories. It could have been from having to do a full factory reset though.

Make sure that you don't have a 6 or 2 or 70 cm amplifier in the antenna line. They have low filters in them to meet FCC type acceptance, the filter will kill your HF signals.

Date: 09/15/07 13:32:06
To: FT897@yahoogroups.com
Subject: [FT897] Portable Rig Dilemma

I'm attempting to re-energize my hamming by doing portable operation out of our travel trailer - I've never done anything like this before. I'm selling my older, larger base station to get a new portable rig. The contenders are the FT-897 and the Icom IC-7000.

The FT-897 seems ideal for portable work, with the ability to put an AC supply inside the unit, or the batteries - this should work well at RV campsites whther there is AC hookup or not.

My dilemma is that the IC-7000 is very seductive with its color screen, filtering features, and smaller footprint. But it also would need external power supplies which would tend to make it more bulky as compared to the FT-897.

So, I guess what I am asking, for those of you who have used both units, how you would compare the two for portable operation out of an RV.

Thanks!

John

One more question for the group: Will the MH-59A8J mic that is allocated as an FT857 accessories, work on the 897?

Dan Schaaf <dan-schaaf@...> wrote: Only one problem with the standard Ceramic SSB filter, if you are working SSB you may find that strong stations 5Khz up will blow by the filter. I have this problem on 6 m. On 6 m , sometimes propagation is so good that 1000 miles away a SSB sig up 5 will be 20 or more over s-9 will still get in.

-Hello JD
I have a elecraft k2, Kenwood TS 480 (mobile) Icom 746 and Have had
a Kenwood TS-570S..
The FT 897D I have had for over a Year. I have Found the DSP on the
RX side for SSB is Fine. So I use the two filter slots for CW one 500
hz and one 300 hz collins filters. I have used the 897D for SSB 2
meters and CW on two meters, works very well. For the Price of the
Radio it is very hard to beat.
I like it better than the TS 570S and TS 480 on SSB HF Receive.
and of course it covers 144 and 440 whitch works very well.

From: Richard Arland, W3OSS
Topic: 1612 Message: 20179

Is there such a thing as an optional mobile mounting bracket for the FT-897?
If so, where do I go to get one? The manual doesn't say anything about it.
Just curious.

The all-band mod removes those memory channels. I all-banded my radio to get to 140Mhz for satcoms and lost those memories. It could have been from having to do a full factory reset though.

Hi Scott,

It depends how old your radio is, the FT897 and the first FT897D's were software Mods, the FCC didn't like it and forced the manufacturer to change the way they are modded. I can't exactly remember when this change took place but the message archives in this group have a lot of messages on the subject. All the info you need is in the files section of this group for either modification - Hardware or Software.

Having said it will TX almost anywhere it will RX; there is no guarantee on how much RF you actually get out. HF is pretty much ok wherever to try, VHF/UHF is more variable.

Best Regards

Andrew - G7MNS

Thanks Dan,
I'm not sure where I would look to find a filter in place, my rig was made for the UK so not sure about FCC rules either.
I contacted the seller Martin Lynch UK and their opinion was the 817nd was built with better audio/sensitivity in mind, and while I've found my 897d works, the audio is not as good as the 817, not even when I change the DSP, so I'm a bit lost and maybe will just have to accept it.

Make sure that you don't have a 6 or 2 or 70 cm amplifier in the antenna line. They have low filters in them to meet FCC type acceptance, the filter will kill your HF signals.

Hey Rich, Yes they do. It is MMB-80 mobile mounting bracket. I found it on yaesu.com under the accessories for the FT-897.

www.hamcity.com sells its for $35.00.<http://www.hamcity.com/SearchResult.aspx?KeyWords=mmb-80>

I would check around for the best price.

If you are going to be moving the rig often then go with the FT-897. I own both. The extra features of the IC-7000 is worth the price but in your case the ease of transportation and integrated power supply is worth more than the IC-7000 features.

To: FT897@yahoogroups.com
Subject: [FT897] Portable Rig Dilemma

I'm attempting to re-energize my hamming by doing portable operation out of our travel trailer - I've never done anything like this before. I'm selling my older, larger base station to get a new portable rig. The contenders are the FT-897 and the Icom IC-7000.

The FT-897 seems ideal for portable work, with the ability to put an AC supply inside the unit, or the batteries - this should work well at RV campsites whther there is AC hookup or not.

My dilemma is that the IC-7000 is very seductive with its color screen, filtering features, and smaller footprint. But it also would need external power supplies which would tend to make it more bulky as compared to the FT-897.

So, I guess what I am asking, for those of you who have used both units, how you would compare the two for portable operation out of an RV.

Thanks!

John

John And All,

I have several rigs, including both the FT-897 and the FT-857D. I also operate from an RV (Motorhome) during the summer. The problem is that some rigs are better than others, depending on the particular setup. If space is at a premium, then the FT-857 seems a better choice. The removable head is a big plus for operating in tight places. But if space permits, I would prefer the FT-897 just to have the bigger control area on the front. It's much easier to use and control the FT-897, but it really isn't that much smaller than a lot of standard home station rigs. There is no ATU in either model, so you may want to add that. I do have the LDG AT-897, and it will work with either type of rig. Of course, that makes the rig that much bigger. Operationally though, both rigs work very well. Not a lot of difference between them. Another plus for both of them is if you opt

for one of the Yaesu ATAS-120 antenna systems. Not a great mobile antenna, but it works, and either rig controls it.

Personally, my favorite portable rig of this type is the Kenwood TS-480. I have the "SAT" model, and it does work better for many reasons. First of all, it is small--almost as small as the FT-857D. It has a built in ATU which works reasonably well. If some sort of ATU is important to you, the TS-480 gives you a smaller overall package than the FT-857D The big plus for me is that the head separates, like the FT-857D, and it is much easier to use. Most of the things you need to change or adjust (like keyer speed or power level)are directly accessible with a button push rather than digging through the menu system. The display is much better, and the head itself is just big enough to not have a bunch of cramped controls. The mounting options for the control head, which Kenwood supplies, are far superior to the Yaesu types. The head can be swiveled for best viewing as well. This works great when operating mobile. Operationally, the TS-480 is at least as good, if not better, than the Yaesu models. The big negative (for some) is that the TS-480 does not cover 2 meters and 440. Another issue is that the Yaesu separation cables can be made yourself, and easily if you just invest $10 or so in a simple tool for crimping the connectors. Just be sure you position the connectors properly at each end (very important).

All three of these rigs are good choices, depending on your needs and requirements. Each has its own set of unique features, so it depends greatly on just what things are most important to you. And how many different situations are you trying to accommodate with one radio? I move radios around a lot--between vehicles, into my motorhome, onto my back patio, motel rooms, Field Day and camping, etc. If your operating habits are as complex as this, one radio probably won't jump out as being "the best" without giving up one or more capabilities or conveniences. But if I had to get rid of 2 of the 3 radios described above, I would probably keep the TS-480. Ah, but then I couldn't work VHF/UHF and satellite stuff, etc. Well, I do have a pretty good HT, and I also happen to have an FT-817! So I wouldn't be totally shut out. If your choice is strictly between the FT-857D and an FT-897D, you probably would find the FT-857D to be the most versatile. If I really only had one radio, that would probably be it.

Hi All,
My FT-897(bought in 2004) suddenly will NOT stay on. When I press the power button the radio powers up for 3-5 seconds and then shuts off.

If I am using the power supply I have to shut off the switch on the back of the power supply to reset the FT-897 before the power button will even operate again, then when I press the power button the same same problem persists. The power supply is good. (Putting out 13.9v according to my meter)I have used it to power my FT-857D with no problem.

When I use the batteries I must reset the battery switch from A to B and back before the power button will even operate again, then when I press the power button the same problem persists.

On a Whim, check the screws seating your PA board.

I have not looked inside my unit or at a service manual. What I am going on here is the chance that a loose ground on the PA board (where voltage comes in and is distributed) would cause a difference in ground potential between it and the board containing the CPU (which should strobe the power switch, looking for it to be pressed).

Since all logic depends on a clear path to ground, any difference in ground potential between 2 parts of the circuit may cause the problem you are describing.

Andrew,

Thanks for your timely reply; and, to all-band an ft-857D, I have to toggle the jumpers correctly (hardware mod) vs. the soft jump mod I found using the CAT port from the rig to an
RS-232 port (software mod), which will not work no matter what eeprompt values I use.

I think Yaesu put a fix in for the soft jump program when they went from 857 to 857D.

If anyone knows of a different program or eeprompt commands that will work, please reply with post.

Thanks all.

Jeff-KD6NBD

It wasn't when they went from 857 to 857D.
I have a genuine D that software widebands, however if you do a reset it reverts back to the original setting. The FCC didn't like this, because of the - who me sir, no I wouldn't Tx illegally see my radio won't do it ! - so about two years ago they made Yaesu remove the software wide banding feature.
You have to play with soldered smt zero ohm links now.

Subject: RE: [FT897] Memory Channels 601-605 Question

Andrew,

Thanks for your timely reply; and, to all-band an ft-857D, I have to toggle the jumpers correctly (hardware mod) vs. the soft jump mod I found using the CAT port from the rig to an
RS-232 port (software mod), which will not work no matter what eeprompt values I use.

I think Yaesu put a fix in for the soft jump program when they went from 857 to 857D.

If anyone knows of a different program or eeprompt commands that will work, please reply with post.

Thanks all.

Does the MMB-80 mount allow for the ready and easy removal of the unit or would a screwdriver or other tool be required to remove the radio. [I am looking for a mobile mount that allows for the ready "demounting" of the unit].

Topic: 20199 Message: 20199

I have a newly purchased FT-897D and a FC-40. I installed them at my QTH, and I cannot get the units to tune 75 & 60 M. All others tune as expected. I have an inverted L antenna, horizontal is 98 ft, vertical is 23 ft. FC-40 is 32 inches above ground rod. I have cut 2 ft increments off the horizontal radiator until I have only the 23 ft vertical remaining, and the units will NOT tune 60 & 75 M bands. Any insight into what the problem is? Possibly very bad harmonics on 60 & 75?? Or is the FC-40 a far cry from the FC-800 tuner, which seems to be able to tune most anything. I wonder if the FC-800 can be setup to function with the FT-897D????

Suggestions please!

20200. Digital Mode Power -897D

Yahoo group: FT897 (2007)
Date: 2007-09-18 03:26:40 UTC
From: alm7bc
Topic: 20200 Message: 20200

Ok Packet and every other mode works as advertised. HF Packet will push 100 watts. Change to Digital Mode and 10-15 watts is it.

My FT-857s have always shown power on Dig in excess of 80 watts if I wanted to push it. Normally only run 50 watts for the Dig modes.

So who has the Service Menu item that controls Dig mode? I just got this radio back from Yaesu and they tell me thier test on UHF showed the correct output of 10 watts. Don't know why they would test UHF out for HF Dig modes.

Please pass along suggestions that will raise the output to normal on HF. Have looked at the Service Manual and didn't see anything that addresses the Dig mode (Maybe its treated like SSB?). In any event would like to use this radio for BPSK and such at 50 watts out.

I have the FT 897D and the FC 40 antenna coupler for a base set up. I found that if I feed a 98 foot dipole with about 23 foot of 500 ohm or 450 ohm twin lead it load upo great on all bands from 10 thru 80 no problem. This is really something aproaching a G5RV except a litle shorter. the specs for the FC40 and the FC30 are the same except the one tunes coaxial line and the FC40 is meant for random wire. Both are 1:3 tunning range. Try it works for me.

Jim,

I don't have a FC-40 but I do have a 897, 857, a couple of LDG autotuners and some experience using them with end fed wires. First, let me say that any wire tuner that will only tune 3:1 VSWR ref. 50 Ohms would be next to useless. I am sure that the FC-40 will tune a much much wider range than that. Otherwise, it could never work with the 20+ metre (66 ft.)wire or the 2.5 metre (8 ft.) mobile whip that they specify in their brochure and manual. I can only speculate that the 3:1 range in the manual is an error, perhaps copied from the FC-30 documentanion. The actual tuning range is probably more like 10:1 or more.

End fed wires that are multiples of a 1/2 wavelength can have a feedpoint impedance of more than 1000 Ohms or 20:1 wrt 50 Ohms. Yaesu and other manufacturers warn that multiples of 1/2 wave length should/must be avoided. Your antenna (98 + 23 ft.) is near enough to exactly 1/2 wavelength on 75 metres. Just to prove the point and to avoid cutting the wire, try clipping on a 10-20 foot wire to the far end of the antenna. Just let the wire hang down and see if that solves the problem on 75 metres.

Bob,
Thanks for the suggestion. I too assumed that Y had goofed on their specs for the FC-40. Hopefully that is true!? Since I have not added wire length, I will try that also. I did cut the end fed down to nothing and it still would not tune 75M. Sort of puzzling!?

Hello all Yeasu and there great FC 40 tunner according to the teck at Yeasu whom I called on the landline after having much problems getting the GD thing to tune up a long wire on all bands told me the tunners output impedance is from 12.5 ohms to 150 ohms per there spec. I then ask him what the spec was for the FC 30 and he told me the same thing. I really think it does better, like perhaps up to 500 or so but a big let down compared to SGC as most of there stuff goes from somewhere around .5 ohm to 5000 ohms or more, I guess they really blew it at Y as far as I am concerned. By the way that long wire (120 foot L)tunned up great on all bands including 160 using the SGC tunner. I finally built a dipole feed with 450 ohm ladder line 98 foot on the top section and 23 or 25 foot on the laddere line drop and it worked great all bands 10 thru 80 but no 160.
At least they still make good radios. Some people are having good luck making or using 1:1 and 1:4 baluns on the output side of the FC40 but I have not tried it yet, I am working on a small loop with the hope it will do a better job for me, something around 6 foot for 14 Mhz. and another around 12 foot for lower. I let you all in on what I find, or out or how it works or how I fried the neighbors cat.

Would that work with an FC30 attached .. i.e., relatively easy removal for use elsewhere? I have a drawing of the various brackets constituting the MMB-80 but my spatial relations must be impaired as darned if I can figure out how the 7 pieces [only two of which have the same shape!] go together . is there a line drawing somewhere showing how it all fits together? My FT897D manual doesn't seem to have any reference to the mount.

From: fzavada7
Topic: 20208 Message: 20208

I am new to this group so the first question I should like to ask is, does anyone know of a light weight headset complete with perhaps a voice tube that will work with the FT897D. I have seen some small headsets that look like they where meant to go with 2 meter handhelds that would fit the size I am looking for however the mike connector I think is going to be a problem. Reason for this is I am thinking of doing some mountain topping this fall and don't want to carry around some big clunky headset with me. I also prefer to use a headset when copying CW. Anyway suggestion to the group and Ideas???

Hopefully of interest,
I use an LDG897 tuner with my 897D and the tuner seems capable of tuning anything, it may go against all tech theory but I worked short hops into Europe on a tuned 50 foot wire just hanging from a small apple tree on 80 metres.
I wasn't intending to transmit as I had no RF earth but thought I'd give it a try on 10 watts and it worked.

From: bobmayerau
Topic: 20199 Message: 20212

Jim,

These things can be tricky to sort out. At least Yaesu, has published the schematic of the FC-40 so we can work out what impedances it should theoretically match at any given frequency. Other manufacturers don't.

Yaesu uses the same L section configuration as LDG with more combinations of L & C. The FC-40 provides up to 13.375 uH in 511 steps of .05uH and up to 2400 pf in 255 steps of 9.375 pf. This should match a very wide range. At 3.9 MHz the minimum impedance is limited to about 5 Ohms at the maximum capacitance. The maximum impedance is well over 1000 Ohms but above 1000 the tuning steps are too coarse to reliably achieve less than 1.5:1 VSWR.

If changing the length of the antenna does not solve the problem, then something else must be going on. Try shortening the ground lead at the tuner. Also a 1:1 balun, isolator or common mode choke (three names for the same thing) at the tuner end of the coax may help.

Antenna systems with remote auto tuners are efficient multi-band solutions. Persevere and I am sure you will get satisfying results.

73, Bob VK2BMU

20213. Re: [FT897D] FC-40 ... & 'transformer'.

Yahoo group: FT897 (2007)
Date: 2007-09-19 11:07:34 UTC
From: Donald MacLean
Topic: 20213 Message: 20213

My 2 cent's worth:

I have space but many trees so I have about 45m of wire in a Z-shape and a counterpoise of about 20m. (Av antenna height only about 4m ... in my eighties now I'm not so good at tree-climbing).

As it's near half-wave on 3.5Mhz the FC-40, as expected, won't tune that band - nor some of 7Mhz and 50Mhz - but is excellent for the whole of the 1.8, 10, 14, 18, 21, 24 and 28Mhz bands.

To fix the 3.5 & 7Mhz gaps someone more expert than I (who isn't?) has sold me a 3-ratio MTFT magnetic balun ("actually un-un") to try (outboard of the FC-40 - but its output is coax) ... anyone advise me on this?

Hi All,

Just some general points about autotuners

When using an autotuner you don't necessarily have to use a resonant length of wire. In fact if you wish to use one for multiband operation it may be best to pick a length of wire which isn't resonant on any of the required frequencies. Let me explain.

Auto tuners tend to fall into three categories. The first type is often referred to as auto coupler and is usually built into the transceiver. They have a limited impedance matching range, and can only cope with VSWR's of 3:1 or less. The main purpose is really just to increase the bandwidth of resonant antennas to provide full band operation.

The second type are those which can match a wider range of impedances, and are able to cope with VSWR of up to 10:1. These are more versatile and can be used to match a variety of coax fed antennas or random wires when used with a 4:1 transformer. A good example of this is the LDG Z-11 (6 ohms to 1000 ohms) or the MFJ-991 (6 ohms to 3200 ohms)

The final type are genuine random wire tuners which should be able to cope with almost any impedance, although in practise they have a finite matching range. Examples include the SGC range such as the SG-237 or MAC-200.

Some test results can be found at :-

http://ham.srsab.se/pdf/test_aut_tuners.pdf

All of these tuners use a switched LC network to provide the best match to between the 50 ohm nominal output impedance of the transceiver and the complex impedance presented by the antenna and feeder. In order to reduce the size and complexity of the design most tuners use a compromise in the maximum values of capacitance and inductance which can be switched into circuit. Unfortunately it is not always apparent what the actual matching range of a tuner is. Some manufacturers give a range of frequencies and impedances the autotuner will handle. Others simply give limited frequency ranges, maximum and minimum wire length, or say avoid using ½ wavelengths of wire (like the AH-40). Care is required when interpreting these descriptions.

Further info can be found at:-

http://www.k0bg.com/couplers.html

As there is a harmonic relationship between the amateur bands, if an antenna is resonant at 3.5MHz it will be presented with a high impedance on frequencies which are even harmonics of the fundamental such as 7, 14, 28MHz etc. In these cases the impedance can become as high as 5000 ohms which is well beyond the matching range of most autotuners. Alternatively if a very short antenna is used, such as a mobile whip, the impedance is likely to be much less than 50 ohms. Typically it can be 15ohms or less, which is also outside the matching range of many auto tuners.

Many manufacturers suggest using a 4:1 transformer in order to bring the antenna impedance within the matching range. Although this works reasonably well, it is compromise, as impedance transformers only perform correctly when the termination impedances are close to the design values. Outside of this operating range, a mixture of antenna and transformer impedances interact in an unpredictable manner which can result in less than satisfactory performance.

Because of the harmonic relationship of the Amateur bands, you are likely to encounter problems if you wish to obtain multiband operation with a random length of wire. One solution is to select a length which has a natural resonance outside the Amateur bands.

For example, one of the shortest lengths of wire which will permit operation from 80m to 6m is around 9.2m giving a resonance of 8.2MHz. The impedance rises to a maximum value of around 1000 ohms on 14 and 18MHz and to a minimum of approximately 78ohms at 7MHz, all of which are fairly manageable. Even my own LDG Z-11 Pro, which is not a true random wire autotuner, can work with this length of wire without an additional 4:1 transformer. If you are using a true random wire tuner, it may still be advantageous to use a length of wire which does not exhibit a very high impedance at the required frequencies, as this can result in very high voltages being present at the feed point. This can place additional stress on the matching components inside the tuner and components such as insulators on the antenna.

Hi All,

Before buying an expensive headset, why not modify a cheap one intended for use with a PC. There are lots of different models around at the moment designed for gaming or IP telephony (such as Skype).

I have built three different versions using PC headsets and even the cheapest one (total construction cost of less than £5.00 or $10) works very well.

Details can be found at:-

Hi all,

This could be a solution for my headset/headphones searching too.
All the quality headset and headphones have fq range something
20Hz...20kHz, which is, in fact, what I don't want. Main reason is
that I hear noise out of the usefull spectrum, 4kHz and above, and
the hum below it.
I look for really BAD headphones that will work in the range
300Hz...3kHz.

If you have access to July 2007's QST magazine there's an article using a cheap computer headset with the IC-706. The schematic doesn't add anything much to the one Martin/G8JNJ posted, but the author also included up/down switches for frequency control and you get pictures of the finished product. Sometimes it helps me to see how someone else laid out the project box.

Please note that I'm not saying to follow the QST article exactly; it looks like the pinouts for the mic are different. Adapt as needed. ;)

From: Michael Warren
Topic: 20218 Message: 20218

I am in need of a little help getting my rig setup with the following equipment.

FT897D, Tigertronics SignaLink USB, Ham radio Deluxe, and Digital Master 780.

I configured the pinout,the FT897D, HRD and M780, but it isn't working right. I need someone to give me help on getting the sytem going. I have read several messages about fragments of the total installation and operations procedures.

I probably need a step by step review of the correct way inwhich to get this up and working correctly.

Thanks

Michael

Martin,
Thank you very much for your 'dissertation' on couplers. I hope everyone reads this information which you have furnished. I'm accustomed to the commercial & military tuners which have to tune anywhere within the 1.7 to 30 MHz range without fail or 'being out of spec' And that includes avoidance of the coupler becoming a 'dummy load'. Thank you again and I wish that the amateur radio manufacturers would cease making their products 'cheaper' rather than less costly.....

Hi Tom:

OK, well, I haven't gotten my MARS license as yet. I will have to ping our state director.

I have tried the solder bridge mods on the DK site. Did a complete reset and it didn't work. I do not have access to the majority of the HF bands. Not worried about V/UHF bands but the HF bands are of prime importance due to the various MARS HF nets. At any rate, I was kinda bummed out by the fact that after making the jumpers on the four locations per the mod list, and a complete CPU reset I could not transmit outside the normal ham bands.

Weird.

73 Rich W3OSS

| Having gone through this process, I recommend that you contact Yaesu tech support. Having made this contact, they will tell you to send a copy of your MARS license. They then will send you the approved
| mod. I would also suggest that you look up DK Mods on the web where you will find mods for this and they
| will supplement the one from Yaesu.

20223. Looking for a FT897-have rigs to trade

Yahoo group: FT897 (2007)
Date: 2007-09-17 14:21:26 UTC
From: John Geiger
Topic: 20223 Message: 20223

I am looking for a Yaesu FT897D as I would like a HF/VHF/UHF rig which I can take portable that has an autotuner installed, and at least a hand mic and power cord with it. I have 2 different rigs that can be worked into a trade for a FT897. Here is what I have:

1. Yaesu FT920 HF/6m rig with DSP, built in autotuner, CW memory keyer, and voice keyer. Works fine, but the case has a couple of rough spots on it. It has the mic, power cord, and manual.

2. Yaesu FT100D HF/6m/2m/70cm radio in excellent condition. It has DSP, a built in CW memory keyer, and does 100 watts on HF and 6m, 50 watts on 2m, and 20 watts on 70cm. Comes with mic, power cord, manual, and original box.

I would also entertain cash offers for either rig. In person trades in the OKC, Dallas, Tulsa area would be nice, but I would ship either rig also.

Anyone have a FT897 or maybe a FT450 they are interested in trading?

From: Graham
Topic: 20089 Message: 20224

Well I suppose everyone is entitled to there opinion ... but when your selling the equipment as a main agent .. you cannot have opinions ...something to do with the sale of goods act .. and selling things by sample and description (uk law that protects the buyer from over stating sellers)

... from a quick did around, these two links would suggest the 897 is actually more sensitive ?

http://www.universal-radio.com/catalog/hamhf/0817spec.html

http://www.universal-radio.com/catalog/hamhf/0897spec.html

.... So I would just take it back , and state 'its not fit for purpose' and get a refund ... hold your ground and you can get the cash back .. as you attempted to resolve the situation and where given 'a opinion' ... 'game over'

I dont think , you will find many owners are 'un happy' with the rig , the handbook may be , but the rig .. I dont think so .

Good luck

G ..

20225. Inrad vs other filters

Yahoo group: FT897 (2007)
Date: 2007-09-20 02:36:01 UTC
From: John AA5JG
Topic: 20225 Message: 20225

How do the INRAD filters for the FT897 compare to the W4RT or Yaesu filters? I know that when it comes to crystal filters, the INRADs are almost always superior, but since these are all mechanical filters, is there still a difference?

Hello to the group.

Myself and fellow HAM Brian(KI4TLW) will be attempting to qualify Trooper Island on Dale Hollow Lake, KY this weekend in the US Island Award Program. Information on times and frequencies follow:

Trooper (KY019) Dale Hollow Lake Clinton County, KY
Trooper (TN044) Dale Hollow Lake Clay County, TN

on 9/22/07 0001Z to 9/23/07 0500Z on 3.950, 7.250, 14.290, and 60 meters channel 2. We will work up as necessary due to QRM.

Note that the island is in two states so you will get credit for 2 islands. We will be calling CQ Island KYnew/TNnew until qualified so give us a shout if you can.

Thanks all,

The original "QRP Power" book by the ARRL had a very nice little gel-cell charger that you can build for a couple of bucks. It won't overcharge the battery and can be built very small, to conserve space. Find a copy of that ARRL pub, check out the article (it was part of another article about a QRP kit radio) and one of the guys who wrote the article for the book came up with the charger circuitry. I have one and use it constantly to charge, and to shape (before charging) my various gel-cell battery packs.

Hi David,

I really wouldn't use a Gel Cell charger on these batteries, at best it could ruin an expensive battery at worst it could totally destroy the battery and many other things with it!!

The batteries need careful charging under controlled conditions - monitoring voltage, charge current and very importantly temperature.

W4RT produces a very good charger that is better value for money than the yaesu unit but I'm not sure whether it will work with the yaesu batteries, they are very helpful though so I would just give them a call.

Hope this helps

Regards

From: Bill Barron
Topic: 20089 Message: 20231

Dear Roger~~

I assume you are basing test on same long-wire antenna
for both the 817 and 897 D. I also assume you have plugged
the antenna 'wire' into the VHF [not HF] antenna
so-239 in rear of 897.

I leave DSP set as follows:
DNR-- ON
DNF-- OFF
DBF-- ON

Based on my rigs, the 817 'hears' a little better than
the [non-D] '897'; but neither are as good as the 847
or old Kenwood TS-520SE. But the battery/portable
features of 817/897 are the important thing to me.

73,
Bill W1WAB

Subject: [FT897] Looking for a FT897-have rigs to trade

I am looking for a Yaesu FT897D as I would like a HF/VHF/UHF rig which I can take portable that has an autotuner installed, and at least a hand mic and power cord with it. I have 2 different rigs that can be worked into a trade for a FT897. Here is what I have:

1. Yaesu FT920 HF/6m rig with DSP, built in autotuner, CW memory keyer, and voice keyer. Works fine, but the case has a couple of rough spots on it. It has the mic, power cord, and manual.

2. Yaesu FT100D HF/6m/2m/70cm radio in excellent condition. It has DSP, a built in CW memory keyer, and does 100 watts on HF and 6m, 50 watts on 2m, and 20 watts on 70cm. Comes with mic, power cord, manual, and original box.

I would also entertain cash offers for either rig. In person trades in the OKC, Dallas, Tulsa area would be nice, but I would ship either rig also.

Anyone have a FT897 or maybe a FT450 they are interested in trading?

HI
your looking to trade please think twice on getting
rid of your ft-100 its a great rig and does the job of
the ft-897.I have a ft-100 and use it as a base and
have had it in moble too A+ rig

Before I bought my 897D I did a side by side comparison with an FT1000 at the dealers. Ok this was a one-off on a particular antenna, at a particular time, but there was nothing to chose between the 897 and Ft1000 in terms of sensitivity.

I have HRD working on mine and can have the Singalink USB up and running by the simple expedient of unplugging it from my laptop and plugging it into this machine. I haven't messed with M780, though. Let me know if I can help. I'm on Skype, if you need to talk....

Give me a REALLY good reason and I'll attempt to measure the
sensitivity of mine. I just got my hands on a nice old Marconi
2018A signal generator.

Accessories for Yaesu FT-897 or 897D.
These are accessories ONLY. FT-897 transceiver is not included.)
One Yaesu NiMH FNB-78 battery (worth $125) This one is gently used in excellent condition.
PA-26B charger (worth $80 new). This one is gently used in excellent condition.
CD-24 charge adaptor (worth $120 new). This one is gently used in excellent condition.
LDG FT meter ($50 new) for the 897D or 857D. This one is gently used in excellent condition.
Everything above $375 I WLL LET THEM GO FOR $275

ACCESSORIES + RIG $800 FOR ALL

I will bring this rig to the ham fest at Radio Expo Chicago FM Club on September 29 in Belvidere, IL

Hello All, I thought I would pass along some info to the group. All Star Link <http://www.allstarlink.org> (ASL <http://www.allstarlink.org>) is a VoiP network for Repeaters and Remote Base. I have 5 nodes. They now have a USB Sound FOB (Click here <http://app-rpt.qrvc.com/usbsoundfob.html>) and you can use your FT-897 as a HF remote. I use one of the nodes with my laptop when I'm on the road to access a FT-897 in La Mesa, Ca. Works great. Anyways just some info for the group.

20239. Re: Signalink USB, HRD, D780 Help Need

Yahoo group: FT897 (2007)
Date: 2007-09-23 14:18:44 UTC
From: Bill Barron
Topic: 20218 Message: 20239

Dear Michael~~

Three basic steps.

1) Hardware.
a) Connect CAT cable from PC to CAT port on radio
b) Connect Signallink from PC to DATA port on 897

2) Radio
a) Set the two [repeat TWO] 897 menus from 'tuner' to CAT
b) set the rig to "dig"[ssb] or 'pkt'[vhf] mode
c) set menus for cat speed to 9600 and data speed to 1200 baud

3) PC
a) Make sure radio is on. Start PC.
b) Start HRD. Set HRD to proper CAT COM port and check RTS box.
c) Connect to radio. Under HRD 'tools'; turn on IP server
c) start DM780. Under 'view' click 'Radio' and 'connect'.
d) Under Tools, Program Options- click PTT tab.
Select proper Signallink Com port and RTS and DTR
Generally you do not have HRD control PTT

You're on air!
Good luck,
73,
Bill W1WAB

Hi -- Name is Bob - Has anyone experienced this??

On CW with the antenna tuned and everything ready to go -- you hit the key -- the sidetone makes noise as normal -- but no powere is generated -- by checking power out meter -

if you turn the frequency dial a bit or hit the tune button it then will transmit

has happened only a few times in the last year --and I keep looking to see if I had inadvertenly hit some button to prevent transmit --but all looks OK

anyone else have this happen ??

Thanks

Dick,
As stated it is an FT-897 w/DSP and comes in the original boxes with
all the accessories that were included as new.

I have an FC-30, two batteries, the 12 v charger, the 120v charger
adapter, and a built-in power supply but I'll be selling those seperately

Per the forum rules let's please take questions to private email.

Regards,
Ron

They all have DSP hence his question. Anyway, presumably it isn't the D
otherwise you'd have said FT-897D! :)

Hello All, I thought I would pass along some info to the group. All Star Link <http://www.allstarlink.org> (ASL <http://www.allstarlink.org>) is a VoiP network for Repeaters and Remote Base. I have 5 nodes (2Repeaters 2Remotes Base). They now have a USB Sound FOB (Click here<http://app-rpt.qrvc.com/usbsoundfob.html>)
and you can use your FT-897 as a HF remote. I use one of the nodes with my laptop when I'm on the road to access a FT-897 in La Mesa, Ca. Works great. Anyways just some info for the group.

Hello group,

I just picked up a clean used FT897D anticipating using it as a 144 and 432MHz IF radio for some outboard microwave transverters. I wonder if anyone here has experience with this?

I'd be interested in breaking out the TX signal before the PA and maybe even driver stages since the tranverters take on only a few mW of TX drive. This is easily done in the FT817 by removing power from the 5W PA stage which lets 20mW of TX signal "bleed" through.

See you on the air,
Frank WB6CWN

Set the offset in the menu to extend past the ability to transmit.

It will still receive, but any attempt to transmit will push it out of band.

Dear Bill, (and others)
I have tested both rigs on same antenna, also tested both rigs on a half size G5RV, its hard to explain the difference in sound but I will try, the 817ND seems to reject background noise better than the 897D and even with various DSP settings, the 897D just sounds like the audio has been put through a graphic equaliser, changing pitch rather than quality of signal, maybe I'm being harsh but I bought the 897D along with LDG tuner, both being brand new, I also have the internal PSU instead of batteries, so I have equipment that is just shy of £1000 and expected it to be better than it is. I do not have the appropriate skills to test the sensitivity, and as anyone can see from my callsign I'm newly qualified, that being said, I have heard far better audio from equipment costing a lot less, my dilemma is simply this, if I send it back and get a report that shows no faults, I have to pay insured postage to and from the shop, if I accept it as it is I will never know if it is doing what its supposed to do.

Dear Roger~~

I assume you are basing test on same long-wire antenna
for both the 817 and 897 D. I also assume you have plugged
the antenna 'wire' into the VHF [not HF] antenna
so-239 in rear of 897.

I leave DSP set as follows:
DNR-- ON
DNF-- OFF
DBF-- ON

Based on my rigs, the 817 'hears' a little better than
the [non-D] '897'; but neither are as good as the 847
or old Kenwood TS-520SE. But the battery/portable
features of 817/897 are the important thing to me.

Roger,
I too have recently purchased a FT-897D. I found after going through a learning process (and I still am doing so..) that I can experience the very same audio characteristics you describe. When the DNR is turned 'on', it changes the audio. When also turning on the DBF, it make the audio sound like a 'rain barrel' or other characteristics. These depend on the high pass and low pass settings of the DSP filter. Look in your manual at the settings for Menu Operation and go through an experimentation experience with the received audio and the DSP settings. It may help you. It did so for me.

Hi Frank and the list.

Get ahold of Jon, W0ZQ (probably has email on qrz.com) or do a google search for him . He has the plans on how to install a downeast microwave 222mhz transverter into the battery bays on a FT897. From that he should know how to get the correct power and such. A FT897 with an internal 222 transverter would make a great roving rig.

Hello Rod: I think you mite have to get the LDG tuner
as it takes care of this problem. I my self was
foolish enough to get the FC 40 to run into the same
problem, I went out and found a good used SGC239
coupler to free up the ACC port now no problems and a
better antenna coupler so it seems. (I can even get on
160 now) Frank

From: Michael Yancey
Topic: 20257 Message: 20261

First, (as mentioned), get an LDG tuner such as the
AT-897 that has a secondary CAT connection on the tuner.

See the photos at:
http://www.ldgelectronics.com/products.php?cID=1&pID=7&v=1
...it shows 'CAT IN, CAT OUT'

Secondly, if you settle on a different tuner, you can build
a superb interface from the April 2007 QST Magazine by
Nenad Rotter, 9A5AN, describing a mic interface that plugs
into the mike jack of the FT-897 and provides a second CAT
port.

Or, you can do like I do and just use an MFJ-969 manual
tuner (!) which leaves the CAT port free.

So, there are a couple of ways to get there.

Perhaps my comment on "copyrighted" wasn't clear. That means that it is ILLEGAL (eg, stealing) to provide or receive a copy of the manual without either purchasing it, or getting explicit permission from Yaesu.

It is my understand that this forum owner has permission for the FT-897 manual, but not the D version.

Besides, the cost is so cheap that anyone who has the radio can afford it.

20267. FT-897-D FM frequency 449.160

Yahoo group: FT897 (2007)
Date: 2007-09-26 19:40:13 UTC
From: cinninnatti
Topic: 20267 Message: 20267

To get this right I will ask you guys how to do it.
In the FM 440 mode my radio goes from 449.00 to 449.025-449-050 -449-075 -449.100 steps 449-150 , I want(449.160) but it goes to 449-175,
Please advise how to correct.
Thanks again guys your a big help

Thanks Luis,
Unfortunately this link also points to the FT-897 manual, not the later D version of the transceiver.
Still looking.

Perhaps my comment on "copyrighted" wasn't clear. That means that it is ILLEGAL (eg, stealing) to provide or receive a copy of the manual without either purchasing it, or getting explicit permission from Yaesu.

It is my understand that this forum owner has permission for the FT-897 manual, but not the D version.

Besides, the cost is so cheap that anyone who has the radio can afford it.

I'm not sure thats right... The 897 had the DSP unless there was an upgrade to it in the "D" version. (D-version, that's funny)

I do know that the "D" version had introduced the .5 PPM High stabillity TCXO. Which is great if your CAP/MARS operator.

But the question remains: If you found an FT-897 radio with out the box or instruction mannual, how could you tell if it was an FT-897 or the "D" version?
(Theres that funny word again!)

20285. Woodpecker type tuning aid in FT817/897

Yahoo group: FT897 (2007)
Date: 2007-09-28 02:16:55 UTC
From: James La Follette
Topic: 20285 Message: 20285

Some time ago I ran into a "woodpecker" diagram on the Fox Tango site. The object of the woodpecker is to pulse the transmitter to reduce the strain while tuning. The FT 817/857/897 have this function built in. This works best if you are not a frequent CW operator as menu settings need to be changed.

* Set CW speed to 60 WPM
* Enable microphone keyer /uses the up/down buttons
* Enable the Keyer (KYR)
* Enable break in (BK)
* Use the "dit" key in the CW mode

I have found this useful with unknown or suspect antennas in an emergency operation center and other places where labels can be wrong or do not exist. This system does reduce the strain on the finals. It also works on VHF/UHF. Even with the reduced duty cycle , it still is a good idea to keep tuning short.

JIM WB4WBL

20286. Original and newer "D" version difference

Yahoo group: FT897 (2007)
Date: 2007-09-28 04:58:24 UTC
From: Frank WB6CWN
Topic: 20286 Message: 20286

I found a Universal Radio store ad that says: "Yaesu now offers the FT-897D deluxe version adding 60 meter coverage and including the formerly optional TCXO9 high stability option."

So if you radio has the 60meter channel assignments --5332, 5348, 5368, 5373, and 5405kHz, its a "D" model

See you on the air,
Frank WB6CWN

> Besides, the cost is so cheap that anyone who has the radio can afford it.

I fully agree, and yet I beg to differ.

I make a point of purchasing the service manual whenever I buy
a new rig - a lot easier to obtain then, than several years later,
and by purchasing the manuals, I make clear that I do need the
manuals and they should plan on producing them for future models.

Creating the service manual is a lot of work for the manufacturers,
and the $25 or so is well worth it.
But, many dealers don't stock it, and/or are unwilling to order.

The Netherlands has an amateur radio community of about 9000 licensees,
and a significant amount of those are not frequent buyers.
There's about half a dozen shops with varying levels of knowledge,
experience, and service levels, but suffice to say that selling
radio gear isn't a career move to make you rich.

In the past, I have resorted to ordering manuals from places like HRO,
but ordering from the Netherlands is a non-trivial exercise, and,
unless you have a good relationship with the seller (Hi Barry!),
they have to resort to shipping methods that easily cost twice
as much as the manual itself. And there's customs clearance costs..

I ordered my FT897D service manual, with some other things,
at a German shop as the other things weren't available here.

The manual I received was the FT897, not the D model, and it was
on a computer writable CD, without label, clearly a CD copied locally.
I doubt Yaesu has seen a single penny from this manual sale.
When I asked, they said they didn't have a D model service manual,
and the differences are small enough that I can make do with
the manual I officially purchased.

Having said that, I believe that the exercise above does
qualify me for a -D service manual, and if I find one, I'l grab it.
Yaesu, nor it's dealer network, seems to care about this, and
I sometimes wonder why I bother.

Finally, I point out that Alinco puts all their service manuals
online for download. They're a lot more terse, but good enough
for people with a little experience (to which I think I'm qualified
given the repairs I've done the years).

If Yaesu decides that selling service manuals isn't critical
to their business, then perhaps they should consider the same model;
I don't mind the money, but for the life of me I can't see why
buying these manuals should be any more complicated than
buying a battary pack, or a pouch.

73,

Geert Jan PE1HZG

20290. The difference between FT-897 and FT-897D

Yahoo group: FT897 (2007)
Date: 2007-09-28 11:35:30 UTC
From: Buckskinner38
Topic: 20290 Message: 20290

Well, this has been an interesting topic. I am glad all of you have responded with your input. But I think I maybe able to put this to rest if no one else has any other ideas on the matter.

(Yeah I know, It looks like I'm answering my own question. But I didnt want to leave this topic open and I wanted to pass on what I had found.)

For those who don't know me...I'm not a FT-897 owner but I'm looking at buying one. So, I went to our local candy store and asked the tech (Not the salesman) here what he had to say:

Based on the service bulletins...
The FT-897 does not have the TCXO 9 - It's sold as an add on feature for MARS/CAP operators.

The new FT-897D version includes coverage of the U.S. 60-meter (5 MHz) band, along with the 0.5 ppm TCXO Unit.

Here the hidden difference: The FT-897D also made changes to the speech processor. I believe they changed the filter from one manufacturer to another due to the quality of the part and some other minor problems that was being seen in the service department.

I am not sure of who made what and where they where made but I do know that was a major change to improve the radio's quality.

Did you do the MARS mod or mod? if so it will clear the memory. Can you key
up 60M?

Dave:

I have a Kenwood TS-850 (Sorry aint getten rid of it)... I had just sold my Yaesu FT-736R and I have a chance to pick up a FT-897 w/accesories for around 850... The 60m option doesn't appeal to me since were restricted - it sounds like its going to be crowded. (I know- use it or loose it)

If I get the FT-897 I wanted to know what else seperated the "D" from the rest of the herd and if being without all those "D" features would I be happy with just the rig itself? (Questions only I can decide on)

I didnt want to buy the rig and be unhappy with it! I didnt want to get it and have to send it in to get fixed because of something I overlooked... I've been burned before so I'm covering my butt!

There are a ton of feature Yaesu offers with the FT-897 series of radios - The main selling point with me is ALL MODE, ALL BAND and its small. Its a station in a bag plus it looks great with my VX-7R... I've also applied for my MARS license, so the TCXO 9 is something I'm going to have to get.

Ive seen 3 FT-897 in my area 2 are claimed to be D's but no box and the manuals are copies...The FT-897 is all together - original box, original manuals... To the guy who shouted check the serial numbers ---I thought of that --- Tell me where there located at and I will... All Ive found is product ID not serial. Nothing matches up to what I read about Yaesu serial numbers. Besides that, people get a little nervous If you come at the rigs with a screwdriver

I'm not going into the rights and wrongs of copyright but do lean to wards the thought that if you spend £500 + for a radio then it should include the service manual as well as operator manual

Ive found one with a simple google search...dodnt want to debate the rights and wrongs but might be worth a try if you are so inclined.

I purchased mine on a CD from Yaesu UK for £25.00. The CD has the advantage that you print the pages you need (ie bias settings!) and it doesn't matter if you spill coffee on them!

Yes you can retro fit the TCXO 9.

All FT897's have DSP. Whether they're all the same I wouldn't know. Mine's a pre D version.

On HF, due to high noise levels here, I have the DNR turned all the way up to 16, and set the DBF low pass to around 2250, sometimes a bit lower depending on noise. I leave the high pass at around 200hz to eliminate the ubiquitous PL tones on FM signals around here. And on FM, I usually drop the DNR (though it sometimes helps on weak scratchy sigs) and open the low pass all the way up to 6000.

These two values (DNR and high pass) can be accessed easily by just selecting the DSP menu with the DSP button in the upper right corner and then leaning on A or C to get the menu item to adjust. You MUST, however, hit the function button, not A or C to return or the new value you dial in will not be stored in the radio. Hitting A or C (whichever led you into whichever menu) again will just put you back as you were before.

From: earicci
Topic: 20304 Message: 20304

Certainly many already know this - Gigaparts is having another 10% off sale for those buying with Paypal or Google check out. They had a similar sale a few months ago.

The price for the 897D is $ 737.10 SHIPPED.
The price for an 857D is $ $ 629.10 SHIPPED.

I am highly tempted to pick up the 857D to complement the 897D I already own.

At those prices, why buy a used one.

Roger,

Flicking back through the posts this has sort of been touched upon but what do you have the high and low pass filters set to?

The out of the factory setting give a bandwidth of nearly 6Khz - a little excessive.
Squeezing this down to approx 2.3 Khz
(at work so can not check upper and lower cuttof but guessing something like 240 to 2600 Hz) will cut a lot of the noise.
Make sure that DBF is on.

See manual page 17 - mult row function P

Subject: Re: [FT897] Re: New 897D Deaf as a post?

Dear Bill, (and others)
I have tested both rigs on same antenna, also tested both rigs on a half size G5RV, its hard to explain the difference in sound but I will try, the 817ND seems to reject background noise better than the 897D and even with various DSP settings, the 897D just sounds like the audio has been put through a graphic equaliser, changing pitch rather than quality of signal, maybe I'm being harsh but I bought the 897D along with LDG tuner, both being brand new, I also have the internal PSU instead of batteries, so I have equipment that is just shy of £1000 and expected it to be better than it is. I do not have the appropriate skills to test the sensitivity, and as anyone can see from my callsign I'm newly qualified, that being said, I have heard far better audio from equipment costing a lot less, my dilemma is simply this, if I send it back and get a report that shows no faults, I have to pay insured postage to and from the shop, if I accept it as it is I will never know if it is doing what its supposed to do.

Dear Roger~~

I assume you are basing test on same long-wire antenna
for both the 817 and 897 D. I also assume you have plugged
the antenna 'wire' into the VHF [not HF] antenna

so-239 in rear of 897.

I leave DSP set as follows:
DNR-- ON
DNF-- OFF
DBF-- ON

Based on my rigs, the 817 'hears' a little better than
the [non-D] '897'; but neither are as good as the 847
or old Kenwood TS-520SE. But the battery/portable
features of 817/897 are the important thing to me.

73,
Bill W1WAB

This was the original post ...'''deaf as a post''' in the uk means it
dont here a thing ....

Mines fine , I use a Skanti trp5000 hf/tr with the R5003 rx and a
racal RA6790-GM , some times the commercial kits better , some time the
897 is better ....

Well if those frequencies are saved in memory channels then its a USA model 897D I believe. My Aussie delivered 897D is country code B3 and doesn't have those channels, but certainly is a D.

Cheers,

20314. RE: [FT897] remove 70cm from ft-897-D

Yahoo group: FT897 (2007)
Date: 2007-09-29 15:30:01 UTC
From: Richard
Topic: 20306 Message: 20314

Someone asked that same question recently, and some workarounds were suggested. Did you check the message archive?

I doubt that 70cm can be "removed" so it isn't accessible any more. That would require a firmware change or board modification. My suggestion would be to contact Yaesu.

To say the "FC-30 IS NO GOOD" is just plain wrong, and inflammatory. For antennas that are close to resonance it works just fine. Should you choose to say that the LDG AT 897 is far more flexible and versatile would be far more accurate.

This is poor knowledge on how radio and antennas works to say that FC-30 IS NO GOOD !
It works perfectly for what it is done and particularly to tune multiband resonant antennas.
It is quite non-sense to try to tune antennas which are too far from resonnance.
But maybe some hams have another view on the subject....

20317. Acc Jack, TX command set power level ??

Yahoo group: FT897 (2007)
Date: 2007-09-29 16:23:07 UTC
From: Graham
Topic: 20317 Message: 20317

May of been asked before ,

but using the ACC jack to produce a tune signal ,is there a software setup , user or maint , that sets the power output for this facility ?

ie like the maint command that allows the HF min power to be set down to 1 watt ?

Tnx

G..

Hello Jeff, Well for $850 w/accessories. To me thats not that great. What accessories are you getting? We need three things Radio, Antenna and Power thats it. Spend the $800 on a new FT-857D and your going to happy. Are you going to use it as a base or portable? My guess is that you want to go portable or you would sale me your Kenwood TS-850 for $20 bucks. If your going mobile go for the FT-857D. I have one as well. Read up on all the mobile HF antennas before you buy one.

I have the FT-897D with the two batteries and the charger. OK the batteries and the charging stuff put me back allot. Key word allot. But I don't use them allot. When I go portable, (OK I drive to the camp site. The truck has a great charging system with AC and heat. Oh, and great seats and dry...) I use an old truck battery. Now I have 100 watts, not 20 watts with the internal batteries. I use the Buddipole so I not need a tuner. So I have $800 for the radio (not including battery) and $200 for the Antenna, total $1000 bucks. If you include the mobile generator then add $22,000. If you said $650 for what your looking at then I'm listening.

Jeff,

I have an FT-897D. Works great. It Also has 60 meters. Since all bands are crowded, 60 meters in comparison is pretty tame. The band is only 3 years old and not many people on it. But a good opportunity to be challenged on a new DX band. WAS and DXCC. I have been on 60 for 2 weeks now and have 7 states and 5 countries including England from right here in SW FL. I hear CA and W7s coming in when they are running mobile. Of the 5 channels, only one seems to be occupied with some local ragchewers. But mostly, it is quick QSOs out of respect for the restrictions. And you would be surprised what 50 watts to a dipole (or equivalent of a dipole) can do. I use a G5RV as an inverted V with antenna tuner. Was using a 40 m vertical with tuner until the G5RV proved 3 S units better.

So for a few bucks more, you can get all features including 60 m. You may be happy later that you did so.

I have a 897D, the carton says 897D, the Tx says 897, the label on the Tx says 897 but the certificat from Yeasu with the correct serial number of the Tx say FT-897D and the documentation says it to in English but the French translation says 897 !!!

Good luck.
F5ALJ -Jean-Christophe.

Carl <carls@...> wrote: I just went and checked mine Ken.
Plate has FT-897 on it, no mention of "D".
The carton it came in says FT-897D.
The Serial Number is 4J400377
Anything you can ascertain from the above?

The serial number/model number tag is on the left side of the rig towards the back. I have one "D" and one non-"D", and don't recall if the tag says it's a "D" or not.

From: Carl
Topic: 20286 Message: 20321

Good evening from Melbourne Jean-Christophe,
The confusion goes on.....I just received a Service Manual from Germany, it is labelled FT-897 but is in fact for the 897D, as the text reveals.
Regs.,

Subject: Re: [FT897] Re: Original and newer "D" version difference

I have a 897D, the carton says 897D, the Tx says 897, the label on the Tx says 897 but the certificat from Yeasu with the correct serial number of the Tx say FT-897D and the documentation says it to in English but the French translation says 897 !!!

Good luck.
F5ALJ -Jean-Christophe.

Carl <carls@...> wrote: I just went and checked mine Ken.
Plate has FT-897 on it, no mention of "D".
The carton it came in says FT-897D.
The Serial Number is 4J400377
Anything you can ascertain from the above?
Regs.,
Carl VK3EMF

The serial number/model number tag is on the left side of the rig towards
the back. I have one "D" and one non-"D", and don't recall if the tag says
it's a "D" or not.

Subject: Re: [FT897] Re: Original and newer "D" version difference

Dave:

I have a Kenwood TS-850 (Sorry aint getten rid of it)... I had just sold my Yaesu FT-736R and I have a chance to pick up a FT-897 w/accesories for around 850... The 60m option doesn't appeal to me since were restricted - it sounds like its going to be crowded.
(I know- use it or loose it)

If I get the FT-897 I wanted to know what else seperated the "D" from the rest of the herd and if being without all those "D" features would I be happy with just the rig itself? (Questions only I can decide on)

I didnt want to buy the rig and be unhappy with it! I didnt want to get it and have to send it in to get fixed because of something I overlooked... I've been burned before so I'm covering my butt!

There are a ton of feature Yaesu offers with the FT-897 series of radios - The main selling point with me is ALL MODE, ALL BAND and its small. Its a station in a bag plus it looks great with my VX-7R... I've also applied for my MARS license, so the TCXO 9 is something I'm going to have to get.

Ive seen 3 FT-897 in my area 2 are claimed to be D's but no box and the manuals are copies...The FT-897 is all together - original box, original manuals... To the guy who shouted check the serial numbers ---I thought of that --- Tell me where there located at and I will... All Ive found is product ID not serial. Nothing matches up to what I read about Yaesu serial numbers. Besides that, people get a little nervous If you come at the rigs with a screwdriver

What do you have and what do you want? I think it would be easier if you told us what you need. Like I have the a unit that doesn't has the 60M programed. How would I program 60m in my radio.

20322. Re: Original and newer "D" version difference

Yahoo group: FT897 (2007)
Date: 2007-09-30 09:26:21 UTC
From: g8hul
Topic: 20286 Message: 20322

There is a file in the "Files" section that decodes serial numbers to
date.

If someone can define when the D version started production the problem
of identification becomes very simple.

Hi Group,

I've had a FT 897 since they came out. I've taken the same FT897 on DX-peditions to FT5XO and more recently to ZL8R. I used it primarily as the 6M EME radio where it drove an ACOM 1000 to make several Q's off the moon. It was also used as a breakable beacon on 6M running hours on end trying to attract anybody passing by, if there was any propagation....which there wasn't. It was also used to make CW and RTTY Q's on the other bands during these trips.

When I had to pack the rig for the long trip to ZL8R, I got a second one..this one a FT897D to use. This is a great little radio and the price is right. It functions very well on 6M and it has handled the bumps and bruises of travel just fine.

I have no financial interest in YAESU, have a couple of FT-1000MP's, but am seriously looking at the K3. [:-B]

73 and I remain,

Lew W7EW/W7AT

Lew,

You guys should have convinced Yaesu to make an advertisement just as Icom did for ZL8R. Worked you guys a few times, gud sigs from ZL8.

I have an FT-897D that I use just for 6 and 2. Works gr8.

20327. File - FT897 Group Guidelines.txt

Yahoo group: FT897 (2007)
Date: 2007-10-01 10:09:27 UTC
From: FT897@yahoogroups.com
Topic: 5240 Message: 20327

The FT897 Group averages around 320 (+/-100 one-sigma) messages per month. Because the volume of messages is rather large, I would like to remind everyone of a few long-standing FT897 guidelines to follow. Most of you do so already.

1. Civility. (This is practiced well by our members!)

2. Please sign your messages with name and call sign, e.g., Fred - W1XYZ.

3. When replying to a posting (message), kindly delete all unnecessary text including the trailing text. Only leave the text from the prior message to which you are replying ... <snip> the rest. If one desires to read the entire thread, the command [Up Thread] at the top of the message can be used to read the entire discussion. Remember also that a lot of members have slow connections and some even pay connect time or characters rx/tx. This also helps the clarity of your message.

4. When replying to a post, please decide if your comment should be to the entire group of over 4,300 or directly to the author of the post. When you click on "Reply," it goes to everyone. To reply direct (simplex), you should click on the email address following the user ID line at the top of the post. Notice that only a part is shown for privacy. Also, please think about if what you are about to post in reply to the group really should be to the group ... replies like "I sure do agree with that" doesn't add much to the group. Send thoughts like those direct to the poster please.

5. It is fine for members to post something for sale or wanted to buy ... once per item(s). All questions and offers to buy/sell should be made directly to the poster, not to the Group. The member posting the FS or WTB may post that the item(s) was/were sold/purchased.

6. Posting of commercial items for sale by manufacturers or dealers is also fine, but should be done on an infrequent basis. The FT897 members benefit by learning of hardware, software, sales, etc. before it appears in magazines, etc.

7. New members are all moderated until their first posting. If it follows the guidelines, it is approved and the member is change to unmoderated status. This list is a partially moderated list, i.e., only first message is moderated while later messages are monitored after posting. If an unmoderated posting is found by the moderators to have a problem, then the poster is contacted directly to resolve. Actions are taken against those that chronically violate the rules.

The reason for this form of moderation is to block spammers from the list and it has been working.

8. Do not add disclaimers to your posts that (1) restrict the ability of other members to use the information you post, (2) claim a copyright to your post, or (3) to claim any type of "rights" as a consequence of another member replying to you post either directly to you or to the group.

Thanks to all es 73,
Barry - W4WB
Moderator

Date: 2007-10-02 01:38:07 UTC
From: Buckskinner38
Topic: 20286 Message: 20330

Thanks... I did see that. That sort of spured the question to begin with.

Sorry for the late reply... Been a bit busy but I will try to answer most of the questions thats been thrown my way...Here we go:

First off I bought the radio it is an FT-897 I did not find the serial number because it covered by the FC-30 Antenna Tuner (one of the features)

It came with 2 battery packs, CD-24 Rapid Charger and of coarse the PA-26 AC adaptor,Power supply plug, 2 mics (MH-31 and MH-59)---Actually I found the MH-59 at a garage sale last week - a bit worn but works. Thanks to this group I've even have the service mannual.

I would like to go "all out" on Yaesu products and I'm sure I will eventuly do so. But right now I'm very pleased with it and I'm wondering why I didnt get it sooner...
IMHO...this is one of the coolest rigs I have ever owned.

I have a 5BTV for HF and Comet Dualbander VHF/UHF. I would like to find ATAS 120 for it one of these days...

As I said before I wanted a rig to be as active as I am. I think this will do it for me.

I lost the MOSFET finals in my rig after about 9 months of operation .. the rig was only putting out about 5 or 6 watts ... I sent it in via HRO for warranty repair and I had it back within 10 days .. all working better now ..

No, works fine after 3 years! (I use a PEAK reading bird wattmeter to set AM/SSB peak power)--Sometimes operators try to adjust the radio so as to see close to 100 watts on a CW/average type meter, this causes early failure, AND distorted audio/wide signals.---73, KC3VO-Bob

20337. marker on the volume knob

Yahoo group: FT897 (2007)
Date: 2007-10-04 09:17:52 UTC
From: bigiantrike
Topic: 20337 Message: 20337

Hi all
I have got a problem in that I forget to turn up the volume on my rig and leave it sitting there on squelch thinking the bands are quite today.. There is a line marker on the volume knob but I'm sure you will all agree it is invisible from 2 ft away... I have tried putting a sliver of white sticky tape in the grove but realise this is only a work around and not a real fix. What i would like to do is paint infill the groove with a good red but to do this properly removal of the knob to work on this would be desirable...

my question

Are the knobs pull off (dont want to heave on it and pull something off the circuit board LOL)

and

What if anything have other members done to overcome this problem.

20338. Re: [FT897] marker on the volume knob

Yahoo group: FT897 (2007)

From: Tim Lyons
Topic: 20337 Message: 20338

I had the same problem on my ft8800. So what I did was filled the grooves with paint and let it set up. Not only do I have the volume knob marked (white paint), but I also have the squelch knob (yellow paint) marked. The problem with the ft897 is the squelch/gain knob has a bump without a groove on it. I fixed that as well by pulling it off and etching a groove in it. Works just fine for me. None of the other knobs have any effect (with the exception of the big jog dial) and there is no need to modify that.

All,
Has anyone encountered ignition noise in a S10 pickup truck while in portable battery mode? And...found a solution? This was while using the 897 internal batteries...not vehicle 12v power. Checked the old threads, but couldn't find a solution. Noise varies from S3 at idle to S7 at highway speed. Not a whine, but more like the variable spark sound you would hear on an AM radio. In current state...really cannot use it as a mobile - only portable. However, all is quiet when engine is off. Not fuel pump - checked "key on" to see if when power was turned on - was the electric pump a problem and no...no pump noise. Grounded both ATAS120 and radio to cab metal.73s

20343. Loss of CW Keying Capability

Yahoo group: FT897 (2007)
Date: 2007-10-05 20:33:31 UTC
From: k5btk
Topic: 20343 Message: 20343

Hello to all!
Back in May of 2006, W4TXS reported that his FT-897 had twice lost the ability to be keyed from the keying jack and had to be returned to Yaesu for repair. I read this having experienced the same failure with my FT-897 a year before on Field Day 2005. A month after reading this, on Field Day 2006, mine failed again. When I attempted to get mine repaired the second time, it was lost in shipment while being returned to Yaesu. In August 2006, after being reimbursed by the shipper, I bought a new FT-897D. Although I got through Field Day this year (2007), my new FT-897D just failed yesterday in precisely the same way. The antenna was a Buddipole at the top of a 12 foot mast and fed by 25 feet of coax. The band was twenty meters and the SWR was VERY low (showed one "bar" on the display). But one of the Buddipole's long whips probably came within 8 feet of the radio. In the middle of a string of CW characters, it was gone again - THIRD time for me!
The moral of this story has to be: "**** DON'T OPERATE YOUR FT-897 (D) IN STRONG RF FIELDS WITH A KEY PLUGGED IN THE KEYJACK ***". Getting anywhere near a radiating antenna with a keying lead inserted is asking for trouble!
I am taking the liberty of reproducing last summer's message (#14911) which was submitted to the newsgroup on the occasion of the second failure of this type.
...Don (K5BTK)

About a month ago, a note was submitted by W4TXS in which he reported that his FT-897 had twice lost the ability to be keyed in the CW mode. Although I had experienced a similar failure a year ago, no flags went up until today.
This morning, my FT-897 for the second time lost CW keying. The first time was last year on the morning of Field Day. This year, I decided to get my equipment tuned up a week early - and guess what? It happened again! I had operated for about 30 minutes (on internal batteries) on CW using a Maldol whip mounted on the rear apron SO-239 (and with a 1/4 wave counterpoise). Moving to another location, I found that my SWR (which had previously been flat) jumped up considerably. I had to lengthen the counterpoise to get it down to "2 bars" on the SWR indicator. After a few seconds of keying, I lost output and the sidetone - getting only a "scratchy sound" on key closure. All other modes seem to be fine (SSB, AM, FM). Pressing the PLY1, PLY2, or PLY3 keys still produces CW output and sidetone in the normal fashion. But the key now has no effect. A hard RESET didn't improve matters. This is the same thing that occurred last

year on Field Day.
Last year, the antenna being used was a 1/4 wave vertical with the FT-897 located only about a foot from its base (feed point).
Having not experienced trouble feeding dipoles which were 15 feet or more away, I am beginning to wonder if something about the radio's keying cicuitry is susceptible to strong RF fields.

<snip>

I wonder if perhaps using a shielded cable would help. It might at
least prevent RF from getting in via the dit or dah wire attached to
an iambic paddle.

From: K.Greenough
Topic: 20343 Message: 20345

The PCB tracks from the Key jack go to a
surface mount IC via two tiny surface mount
resistors and these easily fuse. However they
are easy to get at, you don't even need to
remove the board and there are two test points
on the board to make checking easy.
If you are operating within a strong RF field I
would suggest shielded leads for Key, extension
speaker or indeed anything that's connected
and ferrite beads and decoupling cap's for
really strong fields.

From: tim pap
Topic: 20333 Message: 20348

Hi,

I have been using both the 897d and the 857d in a little diesel passenger car.

Having tried all possible combinations of : power supply, connections to antenna (ATAS 120 and various whips), it has become apparent that the QRM is caused by the fuel system in the common rail injection of the cylinders.

When I unscrew the ATAS120 but still leave the antenna coax connected, the noise disappears, along with the desired signal. Various places on the roof were tried with the grounded magmount I use, no difference.

Went to a car electrical engineer and he said, that by EU specification, car engines are now complying to causing no EMI on the LW, AM and FM bands, unfortunately though not the SW bands, let alone SSB or CW.

Someone else in this thread, suggested covering the sources of interference with aluminium foil / copper foil and fixing these on the engine block.

Temporarily, till you sort things out, try these:

Turn auto AGC off --> Tweak with RF gain manually till you reduce the background (ra-ta-ta in my case) noise!

Hope this may help...
Good luck and 70+3,

Tim (MØSVA)

I have been using my new FT-897D for about a month now. I find that I would like to install a detent on the main tuning knob, just as the FT-600 (System 600) has. Or at least some type of viscous damping for the knob to keep it from over-turning or turning and changing frequency from an accidental brush of the hand while using other front panel controls. Anyone have any ideas or has anyone done this?

From: Alexander Giger
Topic: 20354 Message: 20354

I have a ft897d and over the last few weeks I have noticed that when I turn off the unit for 5+ min... when I turn it back on the unit always resets itself to HF frequencies... even though I left it on UHF or VHF... it's weird...

Every other function is fine, the unit works great... just if I leave it on 146.520 say when I turn it back on the next day it might be on 7.000

Anyone else have this problem? is it even a problem? if so is there a fix or a repair?

The unit is stock with no mods done to it...

thanks for whatever help you guys can give.

There was a recent article in Aust AR mag about diesel pump/injector noise
and a possible cure.
Is the pickup Petrol or Diesel?

Hmm, I have also lost mine, same way, but I put a strereo jack in the side
of the mike hardwired to the up down buttons on the mike and plug my paddle
in there, works fine.
Mind you I have to have the rig set to MIKEKEY and you can't use a straight
key.
You would think as the rig is used portable etc Yaesu would harden them
somewhat to such things.

20363. Internal auto tuner

Yahoo group: FT897 (2007)
Date: 2007-10-04 02:42:56 UTC
From: n9nbn
Topic: 20363 Message: 20363

I saw the post from K4SGT on his mod of an internal tuner, and I wondered if anyone else had tried something similar. I think it would be real nice to not have a tuner hanging off the side of the radio. I will not have a need for the battery compartment anyway.

Ideas guys?

Mike N9NBN

20364. Home Brew Batter Packs of "C" Cells.

Yahoo group: FT897 (2007)
Date: 2007-10-04 14:07:10 UTC
From: modembreath
Topic: 20364 Message: 20364

Has anyone else attempted this?

I built two packs of 11 batteries each of nimh 5000 mAH C cells. They fit just fine in there. I hooked up the charger through a couple of steering diodes and the whole thing with 22 batteries and charger cost approximately $150 total.

I get about 4 to 5 hours of run time on each pack.

I was just wondering if I'm missing something, since I don't see anyone attemping this.

Would this be a hard fix for someone wih half reasonable soldering skills (me).
And would I need to use SMDs to replace the resistors, or could normal resistors be made to do the job?

ALL noise blankers "audio cracks a bit on receive." That is a given
with ANY noise blanker.

Consider yourself lucky that the noise blanker actually blanked your noise.

By the way, it's probably the fuel pump sending unit.

Hi David and anyone else interested.

Well, there isn't a whole lot to see since the packs are all wrapped up in insulating tape. But believe me, they will all fit along with the steering diodes for the charger.

I used 22 Tenergy 5AH nimh tabbed batteries in kinda a puzzle looking thing hi hi. I used a single banana type jack I got at Radio Shack and installed it in the center of one of the battery cover outlets. I got a Tenergy Universal Smart Charger hooked to it with the alligator clip adapter that came with it.

The only "problem" is that the charger puts out hash when ever it's plugged in, but it only takes about an hour or less to recharge it, so I'm not off the air for long. I might try putting a toroid and some caps in the circuit to help get rid of it.

Just make sure everything is well insulated and the steering diodes are able to take the charge amps. I charge at the 1.8A setting and it seems to work well.

I know I have some pics somewhere, I just have to go find them showing my octopus bench test setup.

Here's another way of losing cw capability that I found out the hard way. I had an MFJ portable paddle that I operated from the top of the radio. I slid the paddle across one of the cover screws and saw and heard a short occur. I looked under the paddle and saw that one of the wires' insulation was split open and when it made contact with the cover a direct path to ground occured.

According to MY math, if you charge a 5 AH battery at 1.8 amperes, about THREE HOURS will be required to fully charge a depleted battery, not ONE hour! Also, size "C" cells are TOO LARGE to fit the available space! You must have a smaller, different size cell. (Get 11 ENERGIZER or DURACELL size "C" cells from your local grocery/drugstore/radio shack/ home depot/lowes and try them for size)--They will be too large in diameter, and the bottom cover will not fit!---73, KC3VO-Bob Curry

20379. Re: [FT897] Loss of CW Keying Capability

Yahoo group: FT897 (2007)
Date: 2007-10-07 23:57:24 UTC
From: K.Greenough
Topic: 20343 Message: 20379

Hello John,
I think you were asking me about replacing the
resistors in the keying circuit.
First step is to check that it is them at fault.
The Key jack has three terminals. One is ground.
The other two are Dot and Dash if set to keyer in
the menu. These two contacts have a capacitor
[each] to ground which should filter off any RF
picked up on the key or keyer lead, each feeds through
a 1K resistor [R1565 and R1566] and then through a pcb
track [which is sandwiched inside the board] to pins
19 [dot] and 20 [dash] on Q1049. With the top cover
off and looking at it from the front of the radio,Q1049 is
the 80 lead IC [yes 80, scary isn't it hi] at the front left
corner area of the PCB. These two pins are normally held
high [+5 volt] by two 10K resistors, part of resistor chip RB1002.
When the set is working you should find 5 volt on the key jack
terminals. If the Key [or keyer] does not operate you can
short pin 19 and then pin 20 to ground via a 1K resistor, on
CW Tx or CW practice, and the set should produce dots or dashes.
Take great care not to short any other pins on the IC. We are
talking very small here. If the set still does not produce CW then
Q1049 or the circuitry around it is faulty and I would say that this
is a dealer repair, but if it does now produce dots and dashes then
either the the two series resistors have fused [they're 1/16 watt]
or the tracks are open. Changing the resistors involves removing the
PCB, they're on the underside just behind the key jack.
But an easier repair [which also repairs open track] is to run two
leads each with a 1K resistor in series from each of the key jack
terminals to IC1049 pins 19 and 20. Looking at the IC, again from the
front of the set, pin 20 is the last pin on the right side, that is the rear
most pin. pin 19 is the next towards the front. Don't try this repair if
you are nervous working on such small components. But it is quite
simple if you are dextrous and much cheaper than paying a dealer.

I did try them, but found that they were too tight for MY taste! (It is a VERY tight squeeze, but, as you say, you CAN squeeze them in.--I was worried about the thin outer insulation becoming damaged, resulting in a high-amperage short circuit.) If you can maintain insulation integrity, and install overcurrent/overtemperature protection, I suppose they may work, but In my case, the bottom cover would have been noticeably bent, by the time the required additional cell insulation was added, as the cells had very thin and delicate outer insulation, and would have required wrapping with tape, or sleeving with shrink tubing.-Good luck& 73, KC3VO.

For some reason 'industrial' tagged C cells generally seem to have a smaller diameter than the non-tagged variety or alkaline C cells.

The packs that I built fit easily along with 2 thin paxolin sheets for insulation.

Hello Chris,
You can plug a 1mA meter into the 3.5mm socket
just under the front panel. You can calibrate it and
select what it reads via the menu. All explained
in the manual.

Non D versions also had DSP.
The only real difference was the TXCO and that's hardly needed.
Not all Ds had 60M, only the later ones IIRC.
Early Ds and all non Ds could be software widebanded, making it
capable of transmitting on 60M. Later Ds had this ability removed :(

You can save yourself a few quid/bucks etc buy buying a second hand
non D version and you won't be able to tell the two apart.

No, all versions had DSP. I'm sat in front of my non-D version and am currently using the DSP! :)

Mine has the optional filters and hight stability oscillator so other than 60m (and my set can be widebanded whilst the newer D's can't) you really can't tell any difference!

Hello All: within this group if you go back a few years in the message posts (start with the first post and go foward) the differance between the 2 is well documented. I my self took the time to go back and look before I made my purchse (took me a few hours). I believe they also changed some components in the transmitter section (I think it was the drivers) this info I found reading previous posts, takes time but this is the best source for information on the FT897 series wether its a plain or a d. I also seem to remmber it is explained how to decode when your rig was made via the serial number and in the posts right around this time is also when they cut in the FT897D. therefore you can tell via your serial number whether its a D or not. Just trying to help and perhaps it will, like always if I am loosing my mind please forgive me sometimes its just darn right hard to remmber things. Frank

20390. Changeover from FT-897 to FT-897D ?

Yahoo group: FT897 (2007)
Date: 2007-10-08 22:09:47 UTC
From: Martin Rigby - G4FUI
Topic: 20390 Message: 20390

With all this talk of the differences between the two models, I am curious to know if anyone has worked out at what serial numbers they changed.

My 897D is has a serial number of 4E 30 nnnn, most definitely an "early D".

References to the "D" version started to appear in this list around June 2004, so it all adds up, more or less.

It must take a couple of months or so from rolling off the production lines for the rigs to appear in people's shacks in sufficient numbers to feature here ...

20392. 12.5 KHz steps

Yahoo group: FT897 (2007)
Date: 2007-10-08 23:26:10 UTC
From: Terry
Topic: 20392 Message: 20392

Hello.
Can i ask your help please,i have recently bought my FT-897D all is well except i am not able to get the radio to save a 12.5KHz tuning step on 145MHz band in FM mode.

Pressing and holding the F key for a short period of time takes me to menu number 052 ! FM STEP ! at default it is set to 5KHz ---- if i now rotate the vfo knob i am able to select the 12.5KHz step option now, a second press on the F key brings me out of memory mode.

I would have now expected to be able to tune HF or LF with the mem/vfo control in 12.5KHz steps whilst in FM mode but no the setting is still at 5KHz.

Does anyone have any ideas please.

Many Thanks and 73es.

Terry swl.

20393. Low power output on digital modes with 897D

Yahoo group: FT897 (2007)

A mystery is unfolding in my shack and would like to see if anyone in the group has a thought. Got a new Navigator digital interface (nice equipment), and after getting it all set up, found 1 major problem. When I use BPSK 31 (or other similar modes) there is no (or really low) power output. I spent a couple of hours on the phone with the Navigator folk going through everything and as far as we can tell all is set correctly, but when the radio keys there is at best 2 watts output. CW works fine, but RTTY also suffers the problem. Is there some "magic control" buried in the menus of the Yaseu that I have set wrong? I have read the manual several times concentrating on this issue, and have obviously missed some key parameter although I sure have tried everything I could find. The other option is probably a radio issue :-(.

I have tried MixW, HRD, Digipan, and Hamscope -- all the same. Every other function works fine, but no transmit power output. I checked the back messages in the forum and don't see anything quite the same, although there are a couple of hints I might look into. Anyone out there got everything working?

Don, I am not familiar with the Navigator interface in particular, but it sounds as if the audio output level of the interface to the 897D could be extremely low, or the input of the 897D that you are using has it's level set too low. Sorry for the redundancy if you have already checked these.

20397. Re: [FT897] Re: Display Meter

Yahoo group: FT897 (2007)
Date: 2007-10-09 11:10:45 UTC
From: K.Greenough
Topic: 20359 Message: 20397

Hello Ian,
It's easy to miss things in the manual, and quite
a few features are not mentioned or very poorly.
However, in my manual, which is for the FT987D,
page 19 shows bottom panel connector, a 3.5mm
2 pin jack for an analogue meter. With a 1 mA meter
plugged in you can select via menu No 60 what it
displays on Rx. There is also a setting here for
calibration, it outputs 1 mA so if you have a more
sensitive meter you can put a pot' in series and set
for full scale.
Menu No 61 sets what the meter displays on Tx.
These settings do not affect the normal front panel display
in any way.
Hope that helps,
73 Ken g8beq

Me again Ian,
Being as how the meter is measuring current
a pot would be better wired in parallel as a
shunt if you're using a more sensitive movement.

Hi Jeff,
Thanks for the reply however we seem to be talking at cross purposes - I realize that values can be set at different values for each of the bands.

When I said after setting the tuning step to 12.5KHz on the 145MHz band and then tuning using the MEM/VFO CH knob either LF or HF in FM mode I meant tuning HF in frequency or LF in frequency lets say from a nominal frequency of 145MHz - in this instance the selected value of 12.5KHz is not been being tuned but the tuning returns to its default value of 5KHz.

Hope that's a bit clearer to understand.

Terry !swl!

> I would have now expected to be able to tune HF or LF with the mem/vfo

From: Bill Barron
Topic: 20393 Message: 20401

Dear Don~~

Not sure what a 'Navigator' unit is, but try these suggestions:

1)For SSB make sure 897 set to 'DIG" not USB mode
2)Make sure 897 menu 37 - dig-gain-set to at least 50%
3) Make sure 897 menu 38 - dig-mode - set to psk-31U
4) Make sure 897 menu 39 - shift- set to zero
5) Make sure 897 menu 40 - dig vox- set to at least 50%

The issue may also be no audio getting from PC to rig.

Make sure Navigator sound card (if there is one) selected
in your PC. Ensure that the correct line out (either line out
or speaker) has been selected and not muted.

Hope this helps.

Hello Terry,
It looks like your 897 is faulty, is it still under warranty? Has this developed recently or always been the case?

Hi
I just tried it on mine also and it keeps what ever I set in menu 52 through any number of powe off and back on.

I think there is a gap between what you are telling us and what we are trying to cure. Or its broken!. I doubt this as it wouldn¹t be so specific.

I wondered at one stage whether you had a running man, with a quick press of the on/off button, and were running fast but still had 5khz in men 52?

Its a mystery why your machine is not keeping its settings, do any other memory settings get reset back to a standard value?

Andy

Other steps I can set fine,the radio is almost new - I have just spoken with the dealer who has agreed to exchange the radio - the replacement will be here Thursday of this week when they will collect this one.

Thanks for all the help.

Hello - just done a full reset of the radio, its the first time its had a reset since I bought it new - the radio now does save the 12.5 KHz setting.

I will see what happens now although I may as well go ahead with the exchange just in case.

Thanks.

Wally:
Actually, I'm using a CKT500 Targus computer case.

http://www.targus.com/us/product_details.asp?sku=CKT500

It's not a hard case, but it's easy to carry and has plenty of storage for all kinds of things. I moved the velcro attached separator so that the 807 sits on one side and my FC-40 tuner on the other. Mics and small accessories go in the pockets inside. Cables and adapters go in the large pocket on the front. The charger, its supply, and the charger cables all go in the small pocket in the flap on the front. Also room in back for documentation, notepad, etc. I'd think you'd be able to fit what you need in one of these bags, depending on the type of headphone you're using. It's also a lot cheaper than a Pelican case for that size. That, my Buddy Pole case, and some food and I'm ready for a nice day out.

Topic: 20417 Message: 20417

Hi all !

I am intrested to use CAT program and wire tuner FC40 same time but
both of them are using same CAT connector of 897.

I got info to use mic connetor for CAT, from 897 menu mode 59
it looks possible. After checking microphone connector details I
found that only the up/dwn buttons are changed to serial RX/TX.
Microphone and PTT functions remaining same.
Anybody tried this ? Is it possible to make "Y" cabel for mike and
CAT and is the microphone still usable when settting is CAT mode ?
About the cabel, should it be like CAT cables,
not straight to computer RS232 ?

73s de rami, oh6bi

From: K.Greenough
Topic: 20359 Message: 20419

Hello Graham,
You could well be right, it may not
matter if a calibration pot' is in series
or parallel. But it does output 1 mA
for full scale, if you used a 50 uA
meter with a series pot' it will obviously
only draw 50 uA for full scale, whether
this upsets the output from the meter jack
I don't know. I'll have a play when I get
some free time.

20421. Re: Loss oc CW Keying Capability...

Yahoo group: FT897 (2007)
Date: 2007-10-10 20:47:55 UTC
From: k5btk
Topic: 20421 Message: 20421

As a follow-up to my original posting of last Thursday...
Yesterday afternoon I spoke with a Yaesu service technician who called in response to a letter I sent last Thursday. After asking about my antenna placement, etc., he told me that this type of failure is "quite common". He mentioned that SSB operators are often forewarned that they are experiencing RF problems when they receive reports of distorted audio. But CW operators receive no warning before they lose their keying ability. I asked if he could suggest anything in the way of an external filter that I might build/use. He said that his only recommendation would be to get further away from the antenna. In that regard, I am adding a 50 ft. roll of coax to my travel kit to use with the 25 ft length of coax already on the Buddipole (12 ft. of which is just used to go from the ground up to the feed-point). This should place me about five times as far from the antenna and (if inverse square law applies) drop the field strength at the rig ~25X. Again: "*** DON'T GET TOO NEAR A RADIATING ANTENNA WITH A KEY PLUGGED INTO THE KEY-JACK! ***".
Although I do feel that the designers should attack this "quite common" problem with a board revision (or at least a warning), I have found the Yaesu staff in California to be very courteous and helpful. I am certain that I would never have received a reimbursement for the shipping-loss of my previous FT-897 if Yaesu had not gone to bat for me with the shipper!

20422. RE: [FT897] atas 120 antenna

Yahoo group: FT897 (2007)
Date: 2007-10-10 21:20:49 UTC
From: dalite01@bellsouth.net
Topic: 20420 Message: 20422

Bill,

I have the LDG Z100 and ATAS120 connected to a FT-857 mobile installation.

I ended up putting in a 2 position switch box and a 75m ham stick on the trailer hitch for MARS use on the lower frequencies.

You can try this... Find the 75 m MARS freq, double it, place the LDG in bypass, tune to that freq on the FT-897, and tune the ATAS with the FT-897. Then use the LDG to auto tune for lowest SWR.

The premise here is that you may have less than optimal antenna length, but it may be harmonically related enough to allow a fair transfer of power.

The Ham stick does a fair job with the LDG. Tune for center of operations for the frequencies used near the 75 m band. Do not allow more than 3 inches of the antenna "stinger" to remain recessed in the outer shaft. this will prevent it from resonating when the tip is recessed far enough that it interacts with the outer loading wraps on the bottom shaft.

However, this doesn't allow for any use below 7 MHz to the range that the Ham stick tops out frequency wise. The FT-897 prevents the ATAS from tuning there.

If you are near 7 MHz, tune the ATAS at 7.00 MHz (you may have to add counterpoise wire, dependent on the amount of ground plane that mounting surface creates).
Then, make the ATAS linger by keying the Mic and using the up button next to the tune button, until the SWR starts to rise. Check SWR on AM on the lower frequency. Jockey back and forth until trial and error tunes the ATAS for the best SWR on frequencies slightly below 7.0 MHz.

Can't get too much more specific with exact freqs, but hopefully this will give some things to experiment with.

From: K9ZTV
Topic: 20359 Message: 20424

In reality, every 897 manual has two sections: the "users" portion in the front, and the "menu listings" in the back. Some features can be understood only by applying extra-sensory perception to both sections at the same time.

Yaesu is long on technology and short on common sense (Yamamoto's legacy).

The external meter jack under the front tuning knob has nothing whatever to do with the ATAS. It is a means of attaching an external meter to monitor various functions selectable by menu.

See LDG's offering called the FT-Meter (www.ldgelectronics.com/products.php?cID=3&pID=16&v=1).

20425. LOW POWER on SSB

Yahoo group: FT897 (2007)
Date: 2007-10-09 19:15:33 UTC
From: eptfnj
Topic: 20425 Message: 20425

10/09/07

The SSB power output seems low lately on my FT-897.

It used to give about 100 Watts PEP average using several wattmeters.

Now, the best is 50 watts.

Changed mics - no effect.

Checked SSB mic gain and prcoessing settings - no effect.

Am i missing something or is it broke?

CW & FM will give me 100 watts.

Any ideas?

Thanks,
Ed KC2QBK

I use a Peli 1600, it□s got my FT-897, MFJ analyzer, buddipole, chargers, leads, and the manual tucks behind the foam in the lid.

It□s heavy, so you may want to choose one with wheels on, Peli cases aren□t cheap but if you pay £800 for your radio a good case is worth every penny.

Deion, I have used the Rascal with my 897D for the past couple of years, using USB mode (or LSB for RTTY). Works like a charm. I am plugged into the accessory jack on the back of 897D. Once you get your audio levels set properly, it's pretty much "hands off". I don't use Digipan, but use WinWarbler for PSK and RTTY, and MultiPSK for everything else with no problems.

I have never tried DIG mode. Never needed to...

Hi All,

I have made an cable RJ45 to Din 8 male for Kenwood microphone (see connection below) and I have the following problem :

MC60:

All works fine (up/dn/tx/lock) except when I touch the metal part of the mic, support or button: ALC or MOD bargraph is FULL !!! and no answer to my call.

ADONIS AM508:

Up/dn work fine but when I push the button to enable transmission, the mic and my FT897D begin to click passing from TX to RX until I release the transmission.
(This mic works fine with Kenwood TS-950D).

Does someone has any idea ???

Thanks for help or reading.

From: cherokee_mule
Topic: 20393 Message: 20431

Last night I compared my "default" settings with what Bill posted. I switched my "MODE" to DIG and wasn't receiving anything. Once I matched what Bill suggested for #3 (3) Make sure 897 menu 38 - dig-mode - set to psk-31U) the waterfall appeared. So either with menu 38 not set and "MODE" set to USB, or with menu 38 set to psk-31U and "MODE" set to dig, either way works. The only thing I can think of that might be different is that setting menu 38 kicks on some sort of filter or something...not sure.

The way I understand it is you have to be in one of the DIG modes to
have transmit audio from your sound card go in via the data port on
the back of the rig as well as PTT via that data port.

I was able to transmit using the data port in the back with my laptop sound down to almost mute and my mode set to "USB." To be certain I will do another test tonight with the laptop speakers muted and my menu options set as they were before I changed them.

20436. ATAS 120A and Antenna Boss Connections

Yahoo group: FT897 (2007)
Date: 2007-10-12 17:03:30 UTC
From: Rene Thomas Folse
Topic: 20436 Message: 20436

Hi everyone! I have been QRT for about 20 years, and am about to buy the FT-897 to re-introduce myself to the bands. I have read all available forums, and the manuals before purchase, but still have one puzzle to solve.

I intend to setup CAT to my laptop, and this is done using the CAT/Linear 8-pin mini DIN jack according to page 18 of the manual, which also says the same port is used for the ATAS 120a antenna. So I wonder what do you do if you want to do both at the same time?

Then I look at the manual for the ATAS 120a antenna, and that manual just says "hook up the coax" and makes no mention of the need for any control wire along side the coax. In other words, until I read the fine print on page 18, I assumed the ATAS 120a was being controlled by some type of piggy-back signal down the coax with no other attachment to the FT-897. In retrospect, I doubt how this would work so I probably assumed incorrectly.

Then, I was looking at the manual for the Antenna Boss trying to work up a configuration with the High Sierra Sidekick as an alternative to the ATAS 120a, and the Antenna Boss for sure uses the CAT/Linear 8 pin DIN for control. So, three questions.

1) Does the ATAS 120a actually have some type of control wire that plugs into the CAT/Linear jack despite the ATAS 120a manual not specifying this or showing a picture of this?

2) If so, is it possible to also use the CAT/Linear jack for PC control at the same time, and if so how? Is there some type of Y adapter to plug two things into one 8 pin DIN?

3) Is the High Sierra Sidekick better than the ATAS 120a to justify double the price? E-ham.net has almost overwhelming approval of this product, and the ATAS 120a has about an equal amount of lovers and haters.

I am CC&R impaired and need this antenna to hide in the yard, not mobile, and it will come in for the night and when not used. I will not be going mobile much. I am attracted to the combination of FT-897d and ATAS 120a because I am to lazy to go outside all the time and mess with coils, and clips every time I want to change bands, so this one-button solution offered only by Yaesu is what got me to this rig instead of the IC-7000 in the first place.

Advice greatly appreciated as a lot has changed in 20 years.

Hi Brad,
I use the LDG AT897 and all I can say is it will tune just about anything, including long wires, I even tuned 50 foot of wire about 8 foot above ground on 80 metres, now some will say the tuner is only providing a matched impedence but I worked European stations with this method and no problems, maybe the LDG is not as pretty, but it works well.

Brad,
I have recently purchased a new FT-897D and FC-40 Coupler/Tuner. I am quite favorably impressed with the radio. I have yet to complete my familiarization with all of its functions and menu settings therefore I reserve any personal views on the radio. I did experience quite unacceptable problems with the FC-40 tuner. I was unsuccessful in facilitating the tuner functions for 60 & 75 Meter operation. No antenna length, configuration, or grounding setup would facilitate the tuner's ability to obtain a satisfactory VSWR (according to Yaesu). With help from members of this forum, it was established that the FC-40 can provide only 512 steps of tune settings, none of these could provide a Yaesu acceptable VSWR and therefore the radio indicated "high swr" for both 60 & 75 M bands. I found this to be a very unacceptable characteristic and one impossible to remedy at my installation. So I am now very successfully using a SGC SG-230 auto tuner driving a 150 ft dipole thru 25 ft of 450
ladderline. This setup is able to achieve consistently better than 1.5:1 SWR across all HFham bands and MARS frequencies. Hence, I cannot say anything good about the performance of the Yaesu FC-40 Autotuner. It is compact, light and quite transportable, but I am not satisfied with it.

Lee,

We do not have an issue. We are testing the different configurations
for psk31.

Bryan,

I think I tried every possible configuration. As long as I set menu
38 to the proper mode it will work (i.e user-L or user-U). The same
goes for PSK31-L or PSK31-U. All four menu choices work with
mode "DIGI", "USB" and "LSB".

So I think that covers all of the options. Perhaps it comes down to
which interface/connection the HAM is using to link the rig to the
PC. As Lee is pointing out, the RASCAL works in just about every
mode/configuration possible.

So the question is: which configuration is best/proper!

Brad: I to have the FT897D and the FC40 antenna coupler. I had the same problem and found that solution to be a dipole of 98 feet in total length feed with 23 to 25 feet of 450 open line did the trick however it still would not tune 160, I evven extended the dipole portion a few diferent ways still no luck. I went to the SGC tuner 239 (don't have the big bucks for the 230 so I had to do with the less expensive version) took down the same antenna added 35 feet to each end (now about 165 to 170 total length) and 160 thru 6 meters here I come. Hope this helps. Frank KD7HVL

20447. Re: [FT897] ATAS 120A and Antenna Boss Connections

Yahoo group: FT897 (2007)
Date: 2007-10-13 06:51:54 UTC
From: Andy Williams
Topic: 20436 Message: 20447

Hi
I camp a lot and use the 897d as a portable. I use a 120 which sits atop 4 5foot poles with a footplate I trap into the jockey wheel of my caravan.

q1 The Atas 120 uses the coax to feed its control signals so no extra control wire is needed. I have seen a control box (antenna boss) which converts the high sierra into Atas equivalent. (the one button tune is really special and covers all bands)

q2 I use the cat linear plug for control of the LDG897 atu at the same time as the atas. The LDG has a pass through cat lin socket on the back for other devices. (I have used HRD or the bhi keypad whilst using the atas) (I am also playing with supercontrol 30 day trial)

q3 I have never used the HS Sidekick so don¹t know this.

If you are on a legal band and have enough juice in the batteries the atas symbol on the 897 display goes bold ie ATAS. At this point you can press the tune button and a low power rf signal is sent to the 120. The length of the 120 is then adjusted to lowest SWR by the 897. 30 seconds later the 120 and the 897 are ready for low SWR transmit. If you have the LDG897 this complicates things .You need to disable the LDG before you tune the 120 or they just fight each other. After the 120 has done it stuff you can then switch in the LDG and refine the swr using the LDG tuning. The LDG isnt supposed to work above 60mhz but I found it would make a really good job with a 2m 144mhz signal if the atas was left at the wrong length (ie not at its shortest). You have to use a duplexer for both antenna sockets to feed the atas and its, either, you duplex hf and vhf then feed the ldg or whether you only feed hf to the ldg and duplex after with vhf. Either way you only have one rf wire going to the antenna.

I get really good reports on VHF using an adonis mike, (its like your in the next room)

The new atas 120a were produced after the gulf war as sand was a major problem for them. I wouldn¹t like to leave it out side 24/7 but camping and repeated drying out seems to be what they were designed for.

Hi Gary,

For memory management I use, and thoroughly recommend, FTBasicMMO by G4HFQ. Have a look at http://www.g4hfq.co.uk/ftbasic.html

To control the radio I would try Ham Radio Deluxe, it's free and includes a truly excellent multimode data package too if you wish to try things such as PSK, RTTY and many more of the digital modes.

I have used all the above pieces of software with my FT897D and all are highly recommended.

Sorry to throw a spanner in the works

I have gone the MFJ-993B route for my auto tuner.. I was going the LDG route till I read the reviews on Eham.net..nothing really negative with the LDG just more reviews for the mfj and higher score...lol and the deciding clincher I had the chance of buying a 6 week old second hand one from a silent key sale that had been used for 1 week only at 1/2 prices.

I had decided on the mfj though...So far it has performed faultlessly.

Hi...

I use a Pelicase #1550 for my FT897D and the other stuff.
You can see it at:

http://www.dg8fbv.de/back.htm

When the case is full, it is quite heavy and hard to carry
for portable. To bring all the equipment save to a
transmitting place by car or with another transport device
it is perfect.

As much as I love my Pelican I gave up and now use a neoprene padded computer case that is exactly the size of the 897 and tuner, and slip it into a wheeled Jansport backpack.

Carrying it as a pack isn't all that much fun, but wheeling it through airports and anywhere there are sidewalks has really made me a believer. It may be a concession to late middle age :) but I no longer dread those connecting flights with the scamper through the airport the way I used to, and if you're geeky enough, the extended handle makes a great support for a Buddistick if there's nothing else around.

Hi Dick - its an Eagle Creek, from REI, measures about 12 wide, 14 deep and 2.5 inches tall, mostly black with grey sides and a shoulder strap. Its a darn handy bag, padded, with outside pocket, and it has a shoulder strap, and I leave the 897 in it when I operate it manpack on an ALICE frame as it opens right at the top, leaving just the panel exposed. The 12 wide is a bit wider than the radio plus tuner, but the extra width is taken up in my case by an antenna bracket mounted to the other side. Good luck :) 73 Scott

That factory tuner gets really bad reviews.

The LDG is a good tuner (I use one), if you are using the radio as a portable.

If you are carrying it in a pack or leaving it on the desk, I suggest the LDG Z-11Pro. It's a little cheaper and somewhat more capable, including automatically retuning when necessary. I've got that for my FT-817 and love it.

Hi John,

I Use Suse Linux, currently trialling 10.3, running 10.2 as well though. Have a look at http://www.w1hkj.com, I use Fldigi and have Digi Modes along with basic rig control as well, there is also also an excellent logging program called Xlog available.

You can also download Digipup a bootable CD running Puppy Linux with the Digimodes software and everything else you might need on one bootable CD.

Hope this helps

Best regards

Whoops...you said you were running XP on the iMac. My fault.

I'm assuming you have BootCamp with all installed updates (up to v1.4
of BootCamp). Don't forget if you update BootCamp to v1.4 from a
previous install, you also need to reinstall the newest drivers
created for XP by the BootCamp installer.

I use my MacBook Pro with a Keyspan Serial adapter, the CT-17 cable,
and software from these folks: http://www.dogparksoftware.com/home.html

Hi Brad,

I would also suggest the Z-11 Pro, as the price is much lower.

The AT897 has a reduced impedance matching range (6-800 ohms)
compared to the Z11 (6-1000 ohms) and doesn't have a frequency
measuring capability, so a fast tune (internal recall of a memorised
setting) takes longer.

You can also fit an internal battery pack inside the Z11 so that it
can be used at the remote end of caox some distance away from the
radio. The wider impdance matching range permits limited use of
random wire antennas (with a 4:1 balun on the output of the tuner)
which makes it much more versatile for portable operation.

I have mine attached to the top of my FT897 with double sided velcro
straps. I find it doesn't take up much more space than the AT897
attached to the side of the radio.

Some notes relating to my experiences can be found at:-

http://www.geocities.com/martin_ehrenfried/Antenna.html

Regards,

Martin - G8JNJ

Thanks Andy,
It was a bad case of OE. As soon as Parallel was set correctly all is
well. The Mac had recognized the usb connect but Windows had not.
Thanks again,

Cool! I like what you did. Could you tell us more about your long wire/unun setup? How does it play?

I am currently running an FT-897D through the LDG AT-897 into a Slinky dipole at about 15 feet off the ground (trying not to be too conspicuous). It is VERY good out ~500 miles NVIS, but with a skip zone out the first 50-6- miles or so. Need other, better "stealth" antenna ideas...I think I could hide a longwire like yours in the trees quite well...

20471. Big problems with FNB-897 and OPP-897 batteries!

Yahoo group: FT897 (2007)
Date: 2007-10-16 01:24:45 UTC
From: madengr00
Topic: 20471 Message: 20471

I have two each of the Yaesu FNB-78 and W4RT OPP-897 batteries. I also have a Yaesu CD-24 charger.

I initially bought a pair of OPP-78 and had to return 1 for bad cells. After a few weeks both went bad. I hardly used them, perhaps it was the fact that they would sit for 2 months without use. I didn't think NI-MH had that much of a memory problem.

I got fed up and purchased the Yaesu FNB-78. They worked for a while but then the same problem.

By problems I mean:

1) The other day I was able to charge one of the FNB-78; my last good one. I rigged up a battery profiler with Labview and I discharged it into 13 Ohms. It slowly dropped from 13 VDC to 9 VDC over 90 minutes, then started to quickly nose-dive under 9 VDC, at which point I pulled the load.

2) CD-24 charger starts flashing after 5 minutes for all four of them. It used to only do it
on 3 however the nose-dive on the last one ruined it. I'm not sure what the flashing means. I have searched all over but to no avail.

3) The open circuit voltage on all of them ranges from 2 VDC to 13 VDC. I figured if one cell had reversed I would not get 13 VDC, however that one won't charge either.

I tried a full discharge (down to 1 VDC) on a couple of them but it did not help.

Does anybody have suggestions? This is allot of $$$ invested in batteries and I hate to see them go to waste. They have very little use (perhaps that is the problem) and no temperature extremes.

Thanks,
Lou

Hi,
My first guess is so ascertain if the charger was delivering current at the correct rate, an ammeter in ine would obviously have shown this fault, similarly correct voltage would have to be checked on the charger while under load.
After that I wonder if the battery packs had a regulator circuit, I have known these to fail, especially the thermal fuse side. The only real way of testing that is to bypass the regulator and charge the batteries on a bench supply where you can see voltage and current being delivered accurately.
NiMh batteries do not normally suffer when left a couple of months so I wouldn't suspect that concept, and logically it would seem if you had tried a couple of packs that both failed, its either an unlucky coincidence or more likely the charging process, you've probably thought of these ideas already but just in case I am suggesting logical deduction.

Topic: 20473 Message: 20473

The FT-897 internal batteries are basically DEAD at 12.0 volts, and discharging below this level is risky to the cells, as you invite reverse voltage charging of cells that die early, by the cells that are not dead yet. This often results in shorted cells. FULL CHARGED, these batteries will reach 15.5 to 16.25 volts. If they DO NOT reach at least 15.5 volts, either they are too hot, or you have a defective battery pack or charger. It seems that no one READS the manual nowadays, but if you did, you would find that 9 volts is considerably BELOW the lower operating range of the FT-897, and the radio should be shut off before this level of discharge is reached. To obtain good results, do NOT discharge below 12.0 volts in operation. Discharging into a 12 ohm load to such a low voltage as 9 volts, exposes cells in a series arrangement, such as this battery, to REVERSE charging at 750 ma.! 750 ma. is TOO HIGH for reverse charge current! --Perhaps 50 ma. might be tolerated as a maximum "Full Discharge" current, as this lower reverse current flow is much less likely to induce internal shorting, but the only fully SAFE way to discharge below 12 volts is by "Self-Discharge", which results in long term storage, or by disassembly and discharging each CELL separately, so as to avoid reverse current flow. (no matter how well matched cells are, at a certain point, one or more cells will reach zero volts before its neighbors, and if discharge as a series battery is continued after any cell reaches zero, the depleted cells will be REVERSE charged, with a reverse charge current equal to the load current from the remaining partially discharged cells!----73, KC3VO-Bob Curry

Bob:
Actually the FNB-78 is an 11 cell NiMH pack so recommended minimum discharge would be 11V or 1V per cell. Some NiMH specs seem to say .9 V per cell, but I just don't trust doing that in a series pack since there may be differences between the cells.
You are correct though about the potential to reverse a cell if you discharge the pack too far. Discharging an entire pack to 1V would likely cause irreparable damage. Even to 9V may be risky in such a pack. As such, I think the failures reported were pretty much self inflicted.

The key thing is the AMPERAGE being used, as a very LOW rate discharge, say 1/100 C or less, is less likely to damage the cells than the approx.?1/6 C rate the questioner used. The current used by the FT-897, even during receive, is of a magnitude gret enough to warrant stopping discharge at 12.0 volts, if long battery cycle life is desired. Under light load conditions, with NO transmit, a deeper discharge might be ok, but FT-897 transmit often EXCEEDS the 1C rate. -73, KC3VO-Bob.?

Topic: 20473 Message: 20477

Thanks for the info guys. This really chaps my hide and IMHO is poor design of the FT-897. The rig does cut off at low voltage, however it is less than 12 VDC, IIRC it's < 10 VDC. So by simply leaving the rig unattended in RX it is possible to ruin the batteries. I had read the manual when I first bought it and nowhere does it caution the user about this problem. The batteries came with no manual, and IIRC the charger did not either since I could never figure out what the flashing light ment.

So that's >$400 in batteries down the tube. I'm going to place the batteries and the charger on Ebay; good riddance since they are that touchy I don't want to bother fixing them. Maybe someone else can harvest the cells.

I did buy a #73 deep cycle marine battery for $70 from Costco. It took 68 A*Hr to drop below 12 VDC, at which point I stopped the test. That's plenty of charge for operating over a weekend and allot cheaper; not lighter though ;-).

Thanks,
Lou

Hi All,

Just a suggestion.

For portable operation I use an external 12v 7Ah Gel Cell

Something like this one:-

http://www.hangar-9.com/Products/Default.aspx?ProdID=HAN102

Mine came out of an APC UPS, the cells have to be changed every few years as part of the maintainance policy, and many of the used ones are still perfectly servicable.

I put one of these in the bottom of a backpack with the FT-897 and Z-11 on top.

The cell is connected to the normal 12v DC input of the radio and will permit operation at the 100w power level if required (sometimes useful when intitially calling).

Most of the time I run the TX power at 10 or 20 watts. With an average 10:90 TX:RX ratio I can usually get more than two hours worth of operation using this combo. Which is more than sufficient for lunchtime operation.

It can't be said often enough, apparently because it isn't read often enough, that the "hidden menu" settings are specific to each individual rig and should not be considered universal. Components vary from rig to rig, thus the settings vary. What is proper bias for one rig, may not be proper for another.

Diddle at your own peril (as good mothers used to counsel).

20486. FT-897 and Hampal on 2m

Yahoo group: FT897 (2007)
Date: 2007-10-17 10:49:19 UTC
From: joel
Topic: 20486 Message: 20486

I am trying to get the FT-987 to connect to Hampal for digital sstv on 2m ..... without success I might add at this point.

The local digital group uses a simplex 2m frequency. So, what do I need to a) connect the radio to the computer and b) get hampal to hear and decode the radio signal?

do I go data port on the radio to comport on the PC for example?

All new to me so slightly confused. Not made easier by my not being a windows man usually, so learning the ins and outs of that at the same time.

Any advice greatfully received.

Thanks

20491. CAT jack and SCS-PTCIIpro and Airmail

Yahoo group: FT897 (2007)
Date: 2007-10-17 23:43:47 UTC
From: azranger58
Topic: 20491 Message: 20491

Does anyone have a suggestion how to get frequency control of the radio? The laptop (Vista operation system) and the SCS-PTCpro initialize properly. And, I have the correct cable between the SCS modem and the CAT jack. When I switch frequencies in the Airmail software, the Yaesu radio does not respond. Thanks, Lee, KB9PIP

20492. CAT software?

Yahoo group: FT897 (2007)

Hi group.

My new CAT cable comes tomorrow.

Now, I am wondering what the "best" CAT software for the FT897
Please let me know what software you use, what is good and not so good
about it, does the software cost anything, is the software good for a
speciel kind of opperation (SSB, CW, Digi or ?) is there interface
with DXcluster, QRZ or any other online services ☐ interface to Log
program or not?

If any of the questions above is meaningless, it's simply because the
only CAT program I ever tried was for C64 / IC735.

I am looking for software for both Windows and Linux

Thanks in advance for any input I can get!

20494. RE: [FT897] CAT jack and SCS-PTCIIpro and Airmail

Yahoo group: FT897 (2007)
Date: 2007-10-18 14:07:48 UTC
From: dalite01@bellsouth.net
Topic: 20491 Message: 20494

I don't have experience with the SCS PTCII PRO, but using the PTCII EX and FT-897 with Airmail, I had the same problem initially.

Make sure that in Airmail you choose Yaesu FT8x7 instead of just Yaesu.

Keep the baud rate around 38400.... 96000 may be better to start, and gradually move it up when operation is established.

If the proper radio selection is not made, you will se a minus sign (-) show up in the RIT area when the PTC (or computer com port) establishes PC control.

Make sure the control port is set in the 897 menu options to CAT, rather than tuner or linear.

Hope some of this will help.

Try Ham Radio Deluxe. It gives both Rig Control, and now has digital mode software built in for some of the current sound card modes.

Nick, exactly how are you measuring the power output. You need a
proper preak power meter to measure the true PEP on SSB. Most
amateur power/swr meters are not good enough for true PEP
measurements on SSB.

Measure your output power on FM or CW and then it should read
~100W +/-10W.

I have used the DXLab suite of programs for a couple of years. Very well thought out and implemented. The suite includes logging, call book look up, spotting cluster, propagation prediction, award tracking, rig control, and PSK/RTTY packages.
The software is free, and available at http://dxlabsuite.com/. One of the best features of this package is the support that the author, AA6YQ, gives it.

The bias settings are not done via the menu. The bias
for drivers and PA FETs are done via preset pot's on
the boards. Metering points are provided. The bias
settings are the same for all 897's unless different
transistors have been fitted.
My advice is, if you don't understand these adjustments,
don't do them.

From: martin_ehrenfried
Topic: 20488 Message: 20501

Hi Randy,

In my opinion it's not worthwhile putting in the W4RT 2.3KHz ssb filter in. It doesn't make $129 worth of difference. There is a slight reduction in passband ripple and the edges of the passband are better defined, but you won't hear more stations.

If I was making a choice now, I'd go for the 2.0KHz Inrad filter, then you can select between the existing 2.3KHz ceramic and the much sharper 2.0KHz Inrad when the going gets tough.

I certainly agree with you regarding the service menu settings. They do differ from rig to rig and they should not be casually adjusted without precautions and a clear understanding of what is going on.

However, the bias settings are not a service menu item, they are a physical adjustment of the variable resistors on the top and bottom boards. Those settings should not vary from rig to rig but they unfortunately are notoriously out of spec right out of the box, most often resulting in non-linear operation of the drivers or power amp devices. Unfortunately, due to the design of the bias circuit, the resting current of the finals seems to wander quite a bit and should be checked periodically to assure that the drivers and PA are running linear. If they aren't, you'll hear about it from anyone you try to work!

Hi,

Ham Radio Deluxe looks better visually (especially when using the Google Earth interface), but I find DXLab Suite more useful, especially for DX spotting, once you get to grips with the clunky interface.

Load them both up and try them for a while, they are both well worth the price (free).

I'm using it with the the $20 Yaesu CT62-P CAT Interface from:-

Topic: 20473 Message: 20504

A "12 volt" , 6 cell, sealed Lead-Acid battery should NOT be discharged below 10.8 to 11.0 volts if long life is desired. These batteries also do not fare well if, in use, the load is heavy enough to deplete the charge in less than FOUR hours. Heavy discharge rates tend to decrease the cycle life, and reduce noticeably, the available capacity. As there are variations in construction and chemistry among sealed 12 volt lead-acid batteries, there is variation in ideal charging methods, but these rules generally apply: Store the batteries fully charged, and re-charge promptly after use. A voltage of at least 13.5 volts is required for charging, some batteries will not FULLY charge with less than 14.5 volts!--Ideal charging peak voltage is LOWER under high temperature conditions, and higher under conditions of very LOW temperatures (Perhaps as much as 15.5 volts, around Zero F.)--Generally it is safe to charge these batteries from a vehicle cigarette lighter connection, but the engine/vehicle charging system must be active to obtain near full charge. If you simply desire to reasonably quickly re-charge the battery and disconnect the charger within 6 to 8 hours, connecting it to a fused 14.0 volt power source will generally suffice, but the battery should not be LEFT connected to such a supply indefinitely, as it may overcharge/overheat. Some formulations of battery chemistry prefer lower voltages for long-term float charging-typically 13.2 to 13.8 volts. I would fuse the connection to the battery with a fuse slightly higher than the batteries ampere-hour rating, say about 10 amps for a 7 to 8 ampere-hour battery, and if you want more "Peace of Mind" add a series resistor, of about .2 to 0.50 ohms, rated 25 watts-this will limit initial charge current. Most of these batteries will reach a terminal voltage of at least 14 volts at normal room temperature, during FULL-CHARGE, providing that the charger is capable of providing it.-----These lead-acid batteries DO NOT like being FULLY discharged, and should never be left in a discharged state. Partially discharging the battery, say about 30-60%, and promptly re-charging, will usually give great service life. 73, KC3VO-Bob Curry

Hi Gary,

You may also need use the menu to set the FT-897 to CAT rather than Tuner (Not quite sure of the menu number)as the rear panel connector can be configured for different uses, you may also need to set the DTS & RTS ? lines 'high' as part of the software configuration, as the interface may need to draw power from these lines.

20509. Re: Big problems with FNB-897 and OPP-897 batteries!(Don't Mistreat!)

Yahoo group: FT897 (2007)
Date: 2007-10-19 07:58:31 UTC
From: g8hul
Topic: 20473 Message: 20509

There is some dangerous, or fuse blowing, advice here: it is NOT safe to re-charge SLA type batteries DIRECTLY from a car supply, or a hi-current 13.8V psu come to that.

The initial in-rush current to a discharged battery must be limited to a safe value that is specified by the manufacturer. For the size of battery that may be fitted internally to an 897 this may well be well less than 10A. For larger external batteries it will be higher but thevery high current available from a car supply may still be enough to cause damage.

SLA batteries usually have 2 charging voltages specified: one for "standby" use, where the charger is connected all the time, and one for "cyclic" use where the charger is only connected for the time required to re-charge the battery. The voltage is higher for cyclic use, usually about 15V, compared with 13.5V or so for standby. Intelligent chargers charge initially at the cyclic rate and then switch over to the sayndby rate when the battery is fully charged.

k9ztv TRY READING A SERVICE MANUAL.....the bias or idle current is not a menu adjustable item.it is however the current draw at idle from the pre driver,driver and final stage of the 897.it is set by the use of a amp meter to measure milliamps.not 1 2 3 on menu a.
ki4nbo
K9ZTV <k9ztv@...> wrote: It can't be said often enough, apparently because it isn't read often
enough, that the "hidden menu" settings are specific to each individual
rig and should not be considered universal. Components vary from rig to
rig, thus the settings vary. What is proper bias for one rig, may not
be proper for another.

Diddle at your own peril (as good mothers used to counsel).

hi nick
the bias or idle current settings are not a menu setting.they require internal adjustments to the rig to get them set to service manual specs.if you need more info on this subject with some nice illistrations it can be found in this groups links folder under idle current.about the 70w tops are you using a pep reading meter?most usually show only average readings,when i first got my 897 it showed about the same readings on my meter but it did not show peak reading power.
hope this helps

very well put..do research,read all you can find about the idle current adjustment and certain that you know and understand what you are doing BEFORE attempting this otherwise you can do irreversable damage to the rig.
just trying to make a great rig better through research and reading.

ki4nbo

"K.Greenough" <g0wbm@...> wrote:
The bias settings are not done via the menu. The bias
for drivers and PA FETs are done via preset pot's on
the boards. Metering points are provided. The bias
settings are the same for all 897's unless different
transistors have been fitted.
My advice is, if you don't understand these adjustments,
don't do them.

I have actually TRIED that which I stated, and found that due to the WIRING RESISTANCE and voltages involved, the charging current from a typical automobile cigarette lighter through a properly fused connector and cables, with 0.25 ohm added resistance, has caused no unusual heating, boil-over, bulging, or other dangerous difficulty with lead-acid batteries rated 7 ampere-hour and above, when connected for charging not exceeding 10 hours. I DO NOT advocate leaving a battery thusly connected un-attended in a car parked in the hot sun, as temperatures may rise above 120 degrees F.--at elevated temperatures, charging current and voltage (as previously mentioned) must be reduced. Batteries I tried were made by: YUASA, PANASONIC, EXIDE, SONNENSCHIEN, POWERSONIC, GLOBE, GOULD, VARTA,EAGLE-PITCHER, and WERKER. This selection included lead-calcium, lead-antimony, valve regulated, absorbed glass mat, and flooded electrolyte batteries. If your battery were DEFECTIVE, such as having a SHORTED cell, problems with excess charging will likely occur! The vehicle charging system should not have a sustained output above 14.5 volts. (some vehicles will charge at 15 volts or a little more, after first start in COLD weather-this should drop after 5-10 minutes of operation)-check voltage after running engine for about 10 minutes.--73, KC3VO-Bob Curry

Unless the power/swr meter has a sample and hold detector, which
normally comprise of an op-amp and some componentry, it will have
only a pseudo peak reading, which will not reach the true peak
power. To read (true) peak power, you need a 'scope or a proper
PEP power meter like a Bird 4491 (IIRC). About 70W indicated would
be typical of 100W true peak on SSB speech.

Do you get 100W out on CW or FM?

If so Can you get 100W under "whistle Up" if so try whistling up and change the freq of your whistle as it could be that the set up is not right for the freq range of your voice and you might need to re-set the menu?

Hi Nick,

The most likely problem is that your power meter is not a true peak reading instrument.

If you generate a single tone (CW or SSB with a whistle) the power meter should read 100w in both the normal and peak modes. If this is true then you don't need to worry, you are achieving 100w PEP.

Other waveforms such as two (or more) tones mixed together, or speech introduce a much more complex signal. The vector sum of the individual components cannot be easily be resolved with a simple power meter. All you can obtain is a reperesentation of the RMS peak value, which is not the same thing.

Regards,

Martin - G8JNJ

If you get to the state where there noticable external heating or venting of gas then the battery has already been damaged. You will reduce its life long before you see external signs of problems!!

Quoting from Yuasa's manual on their batteries:

"A discharged battery will accept a high charging current at the initial stage of charging. High charging current can cause abnormal internal heating which may damage the battery. Therefore, when applying a suitable voltage to recharge a battery that is being used in a recycling application it is necessary to limit the charging current to a value of 0.25C Amps. "

Where C is the capacity of the battery in Ah.

So for a 7AH battery that equates to 1.75A which is well within the capabilities of a car lighter socket even allowing for cable resistance.

20521. Re: Trouble with cat

Yahoo group: FT897 (2007)
Date: 2007-10-20 13:05:07 UTC
From: Bill Barron
Topic: 20505 Message: 20521

Dear Gary~~

Set-up FT 897:
1) Make sure Menu 85 is 'OFF"
2) Menu 20 to 'CAT'
3) Menu 19 to 9600bps. More than 9600 creates
annoying cycle hum on 897.
4) Make sure CT62 is securely seated in the COM port
plug.This is generally the problem.

On PC~~
1) Re-start PC.
2) Use 'My Computer' to make sure CT-62 is in correct COM
and that adapter is set to 9600 baud (default), Data bits=8,
Parity=none, stop bits=1, flow control=none.

If you are using USB/serial connector, you need to buy the
correct one from Radio Shack or Manhattan-Products and
load the proper USB/serial driver. See
http://www.manhattan-products.com/driver-usb-rs232.shtml

By the way, USB serial adapters generally COM#5 and higher--
COMs 1-4 reserved for traditional serial ports.

Ham Radio deluxe:
1) In the HRD "sign in" window, where you select the radio,
make sure you've used 9600 baud, correct COM port
and that the RTS box only [repeat ONLY] is checked.
2) NEVER check the 'automatically' connect option.
3) If you don't know correct COM port, set HRD to 'auto detect'.
4) Reminder: 897 must be on, no RF power, before you start
the HRD software!

73,
Bill W1WAB

Just for this weekend I will let them go for $195 + shipping

Accessories for Yaesu FT-897 or 897D.
These are accessories ONLY. FT-897 transceiver is not included.)
One Yaesu NiMH FNB-78 battery (worth $125) This one is gently used in excellent condition.
PA-26B charger (worth $80 new). This one is gently used in excellent condition.
CD-24 charge adaptor (worth $120 new). This one is gently used in excellent condition.
LDG FT meter ($50 new) for the 897D or 857D. This one is gently used in excellent condition.
Everything above $375

Randy,

I have the FT-897D with the Inrad 2.0 SSB filter. It makes a
difference. I notice it, but the difference is not that significance.

I concur with Martin that the 2.3 Khz ssb filter is probably not worth
the $129 - and IMHO, probably nowhere near worth $129 of performance
improvement over the built-in filter.

The 2.0 filter is *probably* worth what I paid for it a few years ago
at Dayton ($100).

This is not a slam against any of these filters. It's more of a
statement of how good the built-in SSB filter in the 897 is.

Hi Gary,

There are a few things that will stop your radio communicating with the software, Email Bob, G4HFQ, he is very very good at helping sort things out for people with a problem connecting to the PC.

Hope this helps

Regards

Andrew - G7MNS

Hi Again Gary,

Just read your other message regarding CAT Baud rate, When using FTBasicMMO for memory management you have to use 9600 Baud as the FT897 and FT897D use that speed when cloning. Probably a good idea to use 9600 for CAT as well, it will save messing about with the settings all the time.

Regards

Andrew - G7MNS

Hi David,

Not sure what you mean but here goes, I use the Mic socket for CAT and switch over to the rear CAT connection for cloning when I need to program memories or wideband the radio.

Hi,

If my understanding of your mail is accurate...instead of turning your radio off with the on/off button, you turned off your power supply and then the problems arose?

If so, I would go for a PARTIAL RESET (thus preserving any memories left intact), if that's possible; sorry haven't my manual with me being abroad at the moment.

Alternatively, I would disconnect power (after turning radio off first with on/off button ofcourse), press the on button then (with power disconnected, and so as to let radio discharge) then after maybe some 5-10 mins try powering the radio and turn on properly to see whether any temporary "mess"has been rectified. If that fails...reset partial, then full if need be and keep your fingers crossed..

Best luck,
Tim

I would like to thank all the help . I am running HRD to control the radio and using the using the DM780 for the Dig part.

What am looking for is program for loading the memory up in the FT897d.

HOW Is the ADMS4B??.

Radio is working good I have made 6 contact with dx station on 15 meter. with low power not bad?? One of the station was 1A4A 21.283mHz.

Thank for the help on software. hope to see you on the band.

Yes, you can run with just two audio cables between the computer soundcard and the rig. However, I would not recommend it as this provides no isolation between the rig and the computer - leaves you open to the dreaded ground loops, weird problems, and a trashy signal. Much better to spend a few buck on a USB interface that provides isolation - or you can build one. A friend recommended the microHam USB II interface and I have been very happy with it! Also provides CAT capability. The SignaLink USB gets good press and has an onboard sound card. However, I have no personal experience with it. My advice FWIW, buy or build an interface.

Good luck and hope to see you on the waterfall!

John,

The TCXO is a "temperature compensated crystal oscillator", and is
basically a high-stability frequency reference for the rig, which
means that the rig is essentially bang on frequency, and stays
there ...

... which I can confirm it does to a very high degree.

0.5ppm TCXO is a 5 parts in 10^7 (10,000,000) Temperature
Compensated Xtal (crystal) Oscillator. This unit provides the
primary frequency stability of the tranceiver. Not too important
on HF SSB, but is of great use on VHF/UHF and data modes.

The temperature compensated crystal oscillator provides additional
stability for digital operating.

The roofing filter in the D-model is improved over the non-D model.

Hi Dan,

OK, I see your point, but what frequency accuracy/stability do the
FCC require? The TCXO would give +/- 2.5Hz (if the rig is to
spec.) which is (IMO) a bit overkill for SSB.

It would explain why Yaesu fit as standard the TCXO.

I can verify the good press for the Signal Link USB is well deserved. With the new digital voice programs hitting the airwaves, having two sound cards available is also a great additoin to versatility in the shack.

20559. light go blinky blinky...

Yahoo group: FT897 (2007)
Date: 2007-10-27 00:48:09 UTC
From: Dan Evans
Topic: 20559 Message: 20559

Greetings all,

I have a quick question. I bought a second hand FT897D a few months ago and so far have been very happy with it. It does have one annoying quirk, however. For some reason that I have not been able to figure out, the battery A/B light blinks continuously. The battery select switch will let you pick which light blinks... My rig does not have the internal batteries installed, so I'm not sure why the light blinks. Any ideas on how to stop the torture? Tape over the bulbs??

Also, I couldn't find in the manual how to "un-skip" menu items. There are directions on how to remove items from the menu list, but not how to restore them. The previous owner removed several items I would like to have access to.

Who has the best price on a CT-62?

Thanks!

20560. S Meter calibration - or not !

Yahoo group: FT897 (2007)
Date: 2007-10-28 16:45:13 UTC
From: martin_ehrenfried
Topic: 20560 Message: 20560

Hi All,

For some time I've been wondering why I can't work some stations on HF.

If they are about S4 or 5 (and running under 1KW) I would expect to be able to work them using 100w. This assumes that each S point up to S9 is approx. 6dB higher in level than the previous one.

Also whilst comparing antennas, I found that the received signal levels measured with the S meter didn't seem to match the differences in transmit levels, that I'd measured using a calibrated field strength meter (assuming that TX and RX signals are reciprocal).

All of this made me decide to check the calibration of the S Meter.

What a shock ! Even when I realigned it using the service manual it was just the same. I realise that most HF tranceivers have poorly calibrated S meters, but I hadn't realised how bad they could be.

Basically there is only a 3dB variation between S1 and S6, 3dB between S6 and S7, 6dB between S7 and S8 and so on. The effect of this is that the lower S meter readings have very little difference in signal level between them. So nearly all signals tend to be at least S6 or more if they are strong enough to register on the meter.

21MHzCW 145MHzCW 145MHz FM
dB dB dB
S1 0 0 0
Delta 0.2 0.4 1.5
S2 0.2 0.4 1.5
Delta 0.5 0.6 1.9
S3 0.7 1 3.4
Delta 0.6 0.5 1.9
S4 1.3 1.5 5.3
Delta 0.8 1 1.8
S5 2.1 2.5 7.1
Delta 1.2 1.2 2.4
S6 3.3 3.7 9.5
Delta 2.9 3.1 1.4
S7 6.2 6.8 10.9
Delta 6.8 7 1.3
S8 13 13.8 12.2
Delta 8.3 8.7 1.5
S9 21.3 22.5 13.7
Delta 8.7 8.3 1.6
S9+ 30 30.8 15.3

Delta 17.6 16.9 5.5
S9++ 47.6 47.7 20.8

So if you are running 100w and the other guy is running 1KW (10dB difference in power levels)I estimate that you need his signal to be at least S7 or S8 to stand a good chance of being able to work him.

Not a big surprise perhaps, but at least now you know why.

Regards,

Martin - G8JNJ

From: Mike Hinds
Topic: 20561 Message: 20561

I've owned my FT-897D since Field Day (purchased new). My (built-in) S-Meter used to work, as did the Spectrum Scope. Now the Spectrum shows only a "flatline". The S-Meter goes up and down opposite the RF Gain, but never responds to a signal.

I've tried semi-intelligent fiddling with MFh, MFi, and Menu functions 60 and 62. The rig sends and receives just fine, but I've managed to disable my S-Meter and Spectrum Scope.

Suggestions? Thanks in advance.

Mike ND9X

I don't think I understand that comment. The 897 S meter is very very non-linear and absolutely useless for any direct measurements. So it could only usefully be used for comparative meauurements where the meter is brought back to the same reading.

If you are measuring sun noise using an external attenuator as long as any agc action and the meter response is consistant with time bringing the meter back to the same reading with the external attenuator will be the same whether of not the agc is turned on or off. In fact some time constant must be applied somewhere in the system due to the random 'peakyness' of noise, otherwise a stable reading cannot be obtained.

However the resolution of the s meter is not really good enough to take accurate readings as it goes in 'digital' jumps. If you are measuring sun noise using an external rms voltmeter on the audio output, which is probably a better way of doing it, then the s meter does not enter into the equation and you can turn the agc off if you wish.

From: Mike Bryce
Topic: 20573 Message: 20573

boys...

it's getting cold outside and the projects are starting.

I just got in some new pcbs that hold a small gel battery charger. It's based on a LM317. There's a circuit that will allow you to charge your battery and run some gear at the same time. If the power fails, the battery takes over running the load. A resettable "chem fuse" protects the battery and charger.

you can use either a terminal strip or plug in molex connectors to connect the pcb to a wall wart 16vac supply.

There's nothing special about the circuit, you can use a lot of stuff out of the ol' junk box.

nothing fancy... but will do 1.5 amps..

BUT!!!

I kinda of messed up a bit and laid out the pcb to hold a pcb mounted heat sink. However... I laid it out backwards!

so the heat sink won't fit the pcb.. Rats!!

the circuit works but you have to use a clip on heat sink now.

any way.. if anyone wants one of the prototypes, they're $8 shipped

the pcbs are about 3" square. Double sided, plated through holes, solder mask on both sides and a silk screen on the component side

I'll include a schematic and part list.. too!

20576. File - FT897 Group Guidelines.txt

Yahoo group: FT897 (2007)
Date: 2007-11-01 10:09:26 UTC
From: FT897@yahoogroups.com
Topic: 5240 Message: 20576

The FT897 Group averages around 320 (+/-100 one-sigma) messages per month. Because the volume of messages is rather large, I would like to remind everyone of a few long-standing FT897 guidelines to follow. Most of you do so already.

1. Civility. (This is practiced well by our members!)

2. Please sign your messages with name and call sign, e.g., Fred - W1XYZ.

3. When replying to a posting (message), kindly delete all unnecessary text including the trailing text. Only leave the text from the prior message to which you are replying ... <snip> the rest. If one desires to read the entire thread, the command [Up Thread] at the top of the message can be used to read the entire discussion. Remember also that a lot of members have slow connections and some even pay connect time or characters rx/tx. This also helps the clarity of your message.

4. When replying to a post, please decide if your comment should be to the entire group of over 4,300 or directly to the author of the post. When you click on "Reply," it goes to everyone. To reply direct (simplex), you should click on the email address following the user ID line at the top of the post. Notice that only a part is shown for privacy. Also, please think about if what you are about to post in reply to the group really should be to the group ... replies like "I sure do agree with that" doesn't add much to the group. Send thoughts like those direct to the poster please.

5. It is fine for members to post something for sale or wanted to buy ... once per item(s). All questions and offers to buy/sell should be made directly to the poster, not to the Group. The member posting the FS or WTB may post that the item(s) was/were sold/purchased.

6. Posting of commercial items for sale by manufacturers or dealers is also fine, but should be done on an infrequent basis. The FT897 members benefit by learning of hardware, software, sales, etc. before it appears in magazines, etc.

7. New members are all moderated until their first posting. If it follows the guidelines, it is approved and the member is change to unmoderated status. This list is a partially moderated list, i.e., only first message is moderated while later messages are monitored after posting. If an unmoderated posting is found by the moderators to have a problem, then the poster is contacted directly to resolve. Actions are taken against those that chronically violate the rules.

The reason for this form of moderation is to block spammers from the list and it has been working.

8. Do not add disclaimers to your posts that (1) restrict the ability of other members to use the information you post, (2) claim a copyright to your post, or (3) to claim any type of "rights" as a consequence of another member replying to you post either directly to you or to the group.

Thanks to all es 73,
Barry - W4WB
Moderator

It sounds exactly like something I've been looking for, but I've got a couple of questions?

Can you share the circuit in the files section? Maybe with an explanation of how the circuit works? Maybe even write it up for QST?

Can it supply a load > 1.5A from the battery while the charger's running? Can it charge a straight Lead-Acid deep cycle battery?

Marc

Hi, Dennis...
Please look back at message number 20343 in the archives. It may explain your difficulty. I just got my unit back from Yaesu in California with a turn-around time of only a few days. The cost of repair was one hour of the service tech's time.
By the way, the service tech suggested a ferrite choke be applied to the keying lead at the rear-panel keyjack. I have the ferrite choke and have put it on the key, but have not yet built up the nerve to go out with my portable antenna and put the system to a "smoke test" - hi!

20583. FT 897D Loss of CW keying

Yahoo group: FT897 (2007)
Date: 2007-11-01 23:02:17 UTC
From: dennis baker
Topic: 20570 Message: 20583

Good evening fellow hams.

First off thanks to all who replied to my posting:

I did read the postings on the internet.

For those who expressed an interest in what happen. Here is the situation when my FT 897d lost its keying. I was tuning up on 17 Meters with 50 watts to a tuner to an end feed wire antenna. I was using a straight key at the time. It is connected to the radio via a twisted pair of wires.

It appears that Yaesu shows this to be a ruggedized radio but in fact has some design flaws.

I, for one, do not believe in having a pin from an processor coming out bare to be used as an external interface connection. This would almost be a violation of ESD principals especially one that is suseptible to RF destruction.

I am looking for a perminate solution that is internal to the radio. Like the use of optical isolator or a pair of relays.

I would like to share diagrams or ideas with anyone that would be interested. The one thing I do not wish for is another piece of ferrite hanging from a connector.

I am always gratefull for any comments to this problem.

From: vr2ax
Topic: 20570 Message: 20584

Very interested in this, as I purchased a new 897D yesterday. I intend to use it mainly for /P cw from a gel cell, at around 20W. Occasionally, it may however be used to drive an amp from the home station.

Wonder if the service tech mentioned what part(s) had failed. I see thet the cw jack input has fairly low (1/16W) power 1K resistors in series with the key line to the cpu, decoupled with 0.001. I suspect that one of these resistors may have fused, but would be worried if the cpu had to be replaced...

Maybe a shielded cable with the shield grounded between the paddle and the jack, as well as a ferrite choke, might be a good idea. Is this a widespread issue with the 897D?

First, FM is not legal on 60M. Only from 29.200 to 29.700 is it legal on HF. Please review your General class reference material. 60M is a special band at the moment and any emission other than USB at 50W ERP on the five permitted channels could get permission to use them revoked by the government.

Second, is it an FT-897 or FT-897D? Only the "D" model has 60M support and that is only available in memory mode. Transmit on 60M in VFO mode is disabled.

Jackie,
Robert is right about the FM mode. But there is a MARS mod you can find to open up the FT-897 allowing you to op on 60 meters.
But please if you can't do it, have a tech do it for you, its not easy
Welcome to the hobby, enjoy

From: Dexter McIntyre W4DEX
Topic: 20585 Message: 20593

Only SSB mode is allowed on 60 meters so the 897D US version
will only transmit in this mode. I'm able to tune my
multiband dipole connected to a tuner just by listening to
the noise from the receiver. This gets the tuning close
enough that the match to the radio can be optimized by
watching the SWR indicator while running SSB with a few watts.

Another fairly cheap method of tuning an antenna is with a
noise bridge. Just google noise bridge and you will get
lots of hits. Here's one I just saw:

http://www.qsl.net/wq1rp/noisebrg.htm

Robert:
Actually, FM is permitted in any phone band on HF except 60 Meters.
Check "?97.305 Authorized emission types" notes 1 and 2. The key is to
keep the modulation index below 1 and to keep the bandwidth no greater
than "communications quality" A3E (AM). The FM-N setting on the FT-897 is
2.5 KHz, so if you keep the audio spectrum to communications quality your
occupied spectrum should be no more than A3E.

Nothing was said about what components were replaced in the last
repair done on my FT-897D. When my first 897 (non-D) was repaired for
the same problem (July 2005), 17 components were replaced including 4
capacitors,
9 resistors, a mini-clamp, a wire assembly, a connector, and a "coil"
(L0022391, coil, E2 0.45-1.4-4T-L).

> Maybe a shielded cable with the shield grounded between the paddle
and
> the jack, as well as a ferrite choke, might be a good idea.

That is what Chip Margelli (formerly with Yaesu) suggested to another
ham when he sent his unit in for repair a year or two ago.

> Is this a widespread issue with the 897D?

It looks that way.

Notice that this last reported failure occurred while the user was
using an end-fed wire (with tuner). If I'm not mistaken, the
radiated field is most intense near the feed-point with this setup.
My first failure occurred with a Maldol whip mounted directly on the
rear antenna connector of the radio. The second occurred when using
a quarter-wave vertical (with tuner) sitting immediately behind the
radio. All these cases result in high RF fields AT THE RADIO.

To "get away" from the antenna, I bought a Buddipole (inductively
loaded dipole) which is placed on a 12-foot high mast and fed with a
25-foot long coaxial cable. However, 12 feet of the coax is used
just in reaching the ground, putting the feed-point only about 10
feet from the radio. Then, getting complacent with the fact that all
was apparently okay, I added longer whips to my rotatable dipole to
increase its efficiency. When the last failure occurred, I had just
rotated the dipole to an orientation that brought one end of the
dipole right over my head (perhaps 6 to 8 feet from the radio) -
DUMB!, DUMB!, DUMB! I've now added a 50-foot roll of coax to my
travel kit to make sure that the radio stays much further from the
antenna - HOWEVER IT'S TURNED!

I've used my 897s quite a bit in the past on my regular "station antenna" (a 20m dipole perhaps 35 feet away) without any problems. It's much more convienient when operating "in the field" to have the antenna closeby. But when using the 897, I think the basic rule is: "STAY AS FAR AS POSSIBLE FROM THE ANTENNA!!"

Does your g5rv work on 80 meters? Are you using a tuner? Most bands on g5rv's require a tuner.

From: James Wilson
Topic: 20585 Message: 20601

The only mode you can use on 60 meters is USB. There are 5 memories at 600 on the FT-897D and the FT-857D that allow you to use 60 meters. I would suggest before transmitting on 60 meters that you read up on 60 meters in the FCC Rule book. 60 meter rules are far different than other HF band rules.

not sure if this is your problem but there are two grounds in the mic plug. One for audio and one for the logic. Usually if they get mixed up, weird things happen in the audio. Perhaps this is along the same line.

20606. "un-hide" menu items

Yahoo group: FT897 (2007)
Date: 2007-11-03 00:17:05 UTC
From: Dan Evans
Topic: 5240 Message: 20606

I found in the manual directions to "hide" menu items from the menu
loop, but I can't find how to "un-hide" items.

The previous owner of my FT897D has cut several of the menu items and I
would like to restore them. Can anyone tell me how to bring them back?

Thanks,

73

Looking to use AGM battery to power my 897 and need wiring diagram for the 6 pin power plug. TNX Bart NC7A

20608. PSK31 mode - what does it do?

Yahoo group: FT897 (2007)
Date: 2007-11-02 16:25:53 UTC
From: John Blacker
Topic: 20608 Message: 20608

The radio has PSK31/digital mode - what exactly does this do?

Also, on my MH-31A8J mic, I have an up/down and fst button. The fst button turns the radio off/on and puts it into fast tuning mode, but the up/dn buttons don't appear to do anything. What should they do and do I have to "enable" something for them to work?

Thanks.

KE7ESP
John.

John Blacker wrote:
>
> The radio has PSK31/digital mode - what exactly does this do?

The PSK31/digital mode on the FT897 is the proper mode setting for all of the digital modes in the rig. It sets the center passband to 1000hz center, by the way. It makes the FT897 a superb digital mode rig and if you have the 500hz or 300hz filters, the rig performs wonderfully on these modes.

Re wiring diagram for 897 power connector: I looked at the 6 pin plug on the back of my 897 and it has two red and two black wires that run to internal ps. I assume the red is + and black is -. Just don't understand why two sets of wires. My schematic shows two 3 pin plugs and I assume they are showing each 3 pin as 1/2 of the 6 pin. So I assume that using just 1/2 of the 6 pin plug (one red and one black) is adequate. But then my medical training has taught me that assumption is the mother of all screwups. Appreciate your comments. Thanks Bart NC7A

They use two pins for each wire color for sufficient current carrying capacity. I imagine each pin will handle 15 amps or so; using two pins each will provide ample margin.

It's (the second positive and negative leads) probably more of a sense line for the voltage. The source line, then line that provides the voltage, and then the line that senses the voltage. The purpose of sense lines on both the positive and negative lines is to keep any current runaway (short) from wiping out the power supply. But the real reason it is usually in the circuit, is to keep from allowing your load (the radio) to be a "firestarter". The wires at that short of a length can handle the current.

Than is my take. Hope I didn't confuse anyone here.

hello
reasonably certain that the connector pins are rated at only 15 amps
per pin
if you notice they have the original heavy mobile cord (think 12
gauge - maybe 10,) yed to the 2 pins- dont remember but think same
inside rig- loked once but cant remember

20614. Re: [FT897] clarification to previous post(use FOUR pins!)

Yahoo group: FT897 (2007)
Date: 2007-11-04 18:23:41 UTC
From: kc3vo@aol.com
Topic: 20614 Message: 20614

Yes, 4 pin wiring of the 6 pin power connector is required to avoid excess voltage drop and poor performance/connector pin overload/heating during transmit. (they are NOT used to "SENSE"voltage or current levels) The parallel connections enable greater current handling ability, with lower voltage loss.

Best way to tell honestly (because I was making an assumption) is to look at the print of the FP-30, it should be clear. I am just going on experience with DC power supplies in circuits. At this point it is all supposition. But, I did notice that on the back of the input power cord for mobile use, the line splits at the connector and feeds the radio with 2 lines. You could be right.

20616. RE: [FT897] clarification to previous post

Yahoo group: FT897 (2007)
Date: 2007-11-04 19:18:31 UTC
From: Richard
Topic: 20610 Message: 20616

In my line of work, I've seen many failed connectors when manufacturers optimistically operate them close to their design limits. In the case of the FT-897, using a connector that each pin can handle 30 or 40 amps with minimal voltage drop would be preferred over splitting the load between two pins, but on the other hand, it seems to work well in this application.

Subject: [FT897] "un-hide" menu items

I found in the manual directions to "hide" menu items from the menu
loop, but I can't find how to "un-hide" items.

The previous owner of my FT897D has cut several of the menu items and I
would like to restore them. Can anyone tell me how to bring them back?

Thanks,

73
Dan

20619. RE six pin connector with four wires...

Yahoo group: FT897 (2007)
Date: 2007-11-05 02:30:55 UTC
From: bebjb8
Topic: 20619 Message: 20619

So I "assume" I can connect both red to battery (+) and both black to battery (-) and all is well as long as charge is adequate??? Other question that comes to mind is that with Yaesu battery packs, transmit is automatically limited to 20 watts. Will this be the case when I use an external battery. I know I can adjust RF out to what ever I want but I'm just curious if the 897 will "see" the battery or will it just "see" something else? Really appreciate the comments and help.
Bart NC7A

20620. RE: [FT897] RE six pin connector with four wires...

Yahoo group: FT897 (2007)
Date: 2007-11-05 04:33:47 UTC
From: Richard
Topic: 20619 Message: 20620

The internal batteries supply power via a different connector. My FT-897 is connected (along with my other radios) full time to a battery bank on an automatic charger and it works fine. The radio should supply up to 100 watts, provided the battery can deliver sufficient current.

Set-up FT 897:
1) Make sure Menu 85 is 'OFF"
2) Menu 20 to 'CAT'
3) Menu 19 to 9600bps. More than 9600 creates annoying cycle hum on 897.
4) Make sure CT62 is securely seated in the COM port plug.This is generally the problem.

On PC~~
1) Re-start PC.
2) Use 'My Computer' to make sure CT-62 is in correct COM and that adapter is set to 9600 baud (default), Data bits=8, Parity=none, stop bits=1, flow control=none.

If you are using USB/serial connector, you need to buy the correct one from Radio Shack or Manhattan-Products and load the proper USB/serial driver. See http://www.manhattan-products.com/driver-usb-rs232.shtml

By the way, USB serial adapters generally COM#5 and higher--COMs 1-4 reserved for traditional serial ports.

Ham Radio deluxe:
1) In the HRD "sign in" window, where you select the radio, make sure you've used 9600 baud, correct COM port and that the RTS box only [repeat ONLY] is checked.
2) NEVER check the 'automatically' connect option.
3) If you don't know correct COM port, set HRD to 'auto detect'.
4) Reminder: 897 must be on, no RF power, before you start the HRD software!

73,
Bill W1WAB

Hi, Per!
In my case, the power was 20 watts using the internal battery in the first two failures (using the rear-panel whip and the quarter-wave vertical immediately behind the radio). After I began using the rotary dipole without problems (initially), I became overconfident. The last failure was at 100 watts! ...Don (K5BTK)

If you connect to your battery via the internal connector(s) you will have the 20W limit. If you connect via the rear panel DC connector the radio will run with the full limits as if running via a PS.

Are you getting power out? You also want to ensure that you have no ALC. It's not easy but one of the skills with any radio is learning how to monitor and switch between alc, swr, and pwr when transmitting.

From: John Earnshaw
Topic: 20629 Message: 20629

Got this of the VX7R forum thought it might be of interest.

Motorola USA has announced its intention to launch a tender offer to acquire a controlling interest in Vertex Standard Co, Ltd. Vertex Standard is the parent company of Yaesu. Motorola will own 80 percent of Vertex Standard; Tokogiken, a privately held Japanese company, controlled by current president and CEO of Vertex Standard Jun Hasegawa, will retain 20 percent, forming a joint venture. The total purchase price for 80 percent of the outstanding shares on a fully diluted basis will be approximately US $108 million

Topic: 9094 Message: 20631

Does anyone have a copy of a warranty for the ft 897d? Yaesu is no help. They say the dealer has them and the dealer says it is just a standard 1 yr warranty.

My credit card will cover warranty for an extra year but they want a copy of the written warranty, which is reasonable.

Other manufactures have the warranty in the owners manual or printed out somewhere, and i cannot find anywhere.

Any help would be appreciated.

Thanks,

ned, ft 897d

What are you using for and interface between your "PC" and FT-897? Your settings will partially depend on the interface. Serial/USB etc.

The warranty card on my FT-857D is serial number specific. Vertex Standard is the outfit responsible for making repairs if the dealer can't help.

Vertex Standard service center is located at 10900 Walker St., Cypress CA 90630. Advance authorization is required before Vertex Standard will accept shipment of a product. They will also want to see a copy of the purchase receipt.

Chuck,
how can I set the FT-897 in FM-N Mode. I found the spec in the manual
(2.5 kHz) but nothing about to go to FM-N.
Any info is appreciated.

--- In FT897@yahoogroups.com, "John Blacker" <joblacker@...> wrote:
>
> The radio has PSK31/digital mode - what exactly does this do?
>

Several things...

1. It disables audio from the front mic connector.
2. Enables input/output from the rear data connector for your sound card.
3. Sets the mode to U or L sideband based on your setting for menu item 38.
4. Enables menu items 36-40 -- digital mode gain etc, so you can set the max input gain from your soundcard and use VOX to transmit if you don't use CAT (Ham Radio Delux) or the PTT pin on the data connector.
5. Allows use of optional filters thru function row "N" if you have them installed in the digial mode you selected.

Works well......and if this posts twice ... sorry... I did not see my first reply show up.

There are many products that have a warranty, but don't have a warranty card, they just mention the warranty somewhere in their documentation.

Claims being based on date of purchase and receipt.

Surely you credit card company has methods to deal with these types of product, which would make the warranty card irrelevant.

Yes I do!
In the "Operatin Manual" for FT897, on page #36 and
#37 you have all about "Digital Mode Operation".
Follow the instructions.
ATENTION at point#6 from page #36..."a few "dots" of
ALC indication shud be observe"
Follow STEP by STEP ALL the instructions!
For me it's good, and work well.
Good luck,

You are correct. The CAT port on the back of the rig does not come in to play for just digital modes. The CAT (with the CT62 cable) is used for rig control, not digital comms. The DATA port is where you will connect your Rascal. In fact, it's a different connector, even. I've been using my 897 with a Rascal that way for quite some time. I use the CAT port with CT62 cable also, but only for rig control.

Hello to all,
If you use Ham Radio Deluxe (HRD) you can do PSK, RTTY, CW(M) etc. only by using your CAT cable CT62 and your PC, no need for any other controller or interface.

It works great

20655. Meter Display When Transmitting

Yahoo group: FT897 (2007)
Date: 2007-11-08 20:40:32 UTC
From: Lee Mairs (SAG)
Topic: 20655 Message: 20655

For some reason my FT-897D now shows ALC while I transmit. I am virtually positive that it originally displayed SWR while transmitting.

I have used menu item 061 to select SWR, VLT, and anything else but ALC, yet the radio continues to indicate ALC. Yes, I even verified that the LOCK MODE (menu item 54) was set to Frequency.

The menu function sets the display of an _external_ meter. The
multifunction button in row I sets the internal one.

This list could use a FAQ page! :)

I need to go back to reading the manual instead of using the "Cheat Sheet" on pg 54-55!

A FAQ page would probably end up longer than the original manual...

20660. MH-59A8J Microphone

Yahoo group: FT897 (2007)
Date: 2007-11-08 23:38:56 UTC
From: n3aep
Topic: 20660 Message: 20660

Any comments on this microphone?
I was thinking of putting this on my XMAS list for use in my truck.
Might be easier than trying to work the radio controls.

I have one.
Best investment I ever made.
You punch the frequency in directly rather than
spinning the dial a bunch of times to get there.

Also have control over some of the other features.

Well worth the money.

I have a MH-59A8J Microphone and like it. They do have an issue with being susceptible to RF getting in, but a torroid core just inside where the cord enters the mike takes care of the issue. I also have the thumb wheel covered with tape; it seems that every time I talked I changed the frequency with my thumb..

20663. Re: psk with 897

Yahoo group: FT897 (2007)
Date: 2007-11-07 05:36:54 UTC
From: jan.9v1lj
Topic: 20617 Message: 20663

Bill, I assume you are receiving already and succesfully decoded other QSOs.

To get the transmit path right

- Check+double check that your soundcard is properly selected in your PSK31 program
- Open up the mixer of the soundcard you are planning to use (loudspeaker icon in the taskbar) and make sure WAVE and VOLUME CONTROL are not muted. Set WAVE control to max and Volume to medium.
- You might want to check that the other mixer controls are muted to avoid any unnecessary noise (like SW Synth or PC Speaker)
- Now, set the TRX to DIG mode, set Menu 31 to PSK31-U (assume you intend to use USB), Menu 36 to 0Hz, Dig Shift to 0Hz
- Set output power to 5w and attach your dummy load.
- Start transmitting with your PSK31 program, the TRX should now switch to Transmit mode. If that does not work, we need to look deeper into your Interface setup.
- Switch the meter display to ALC (Menu i)
- Type something (or transmit any macro in your program).
- Now, using the mixer control for the soundcard, any regulator on your interface and the setting of Menu 25 (DIG Gain), which pretty much all do the same.. (attenuate the Audio signal to the TRX) regulate in a way that you just about do NOT see any deflection on the ALC meter on the TRX display.

Now, say, increase output (Menu 75) to 50 or 60 watt and switch back to the antenna. Try your luck again.

You will have seen that you can choose different audio frequencies to transmit at. Mind you, the ALC meter might show different values depending on which frequency you choose to send to the transmitter. A little readjustment might be needed there.

Regards,
Jan

20664. FTBasicMMO connection

Yahoo group: FT897 (2007)
Date: 2007-11-08 08:48:07 UTC
From: pa1mvl
Topic: 20664 Message: 20664

I am using a FT897D with a USB2 interface from MicroHAM. It works fine for rig-control and digital modes.
Now I want to back up memories and settings using the FTBasicMMO program. What happens:
1. I manage to download all data from the rig the PC. But the rig resets itself in the process ending up in default-factory-state. The data is received by the PC.
2. uploading the data from the PC back into the rig doesnot work. The PC tells me that no acknowledge signal from the rig is received, and the rig ends up in a time-out error. On the router of the USB interface I can see that a some communication takes place, but it is very short.

Does anyone reccognize the problem and knows a solution?

Maarten

I never managed to get it to work either, and eventually bought ADMS instead,
which did work first try.
For the record MacMemoriesManager also works very well too, and unlike ADMS and
FTbasicmmo, it can modify memories directly, without going into clone mode.

I had the very same problem and was black & blue from beating my head against the wall until I contacted the author who patiently explained to me that I had not chosen the correct radio configuration in the programs start up. Once I did it was smooth sailing. My radio was " FT-987D unmodified US model with 5MHZ band in memories M-601/5" g4hfq has written a great program and stands behind his product. Send him an email and he'll be glad to assist you if my suggestion doesn't work.

73
Rick KE7FHK

Now if I could only figure out how to configure this beast for packet with my laptop and BUX COM Rascal model V GLX. Can't seem to get the PTT activated through the USB to Serial converter despite checking and triple checking all my computer and comm. port set ups. What I really need is a local Elmer to hold my hand one time with this so I can document each settin on both the radio and my computer.

From: Dan Schaaf
Topic: 20669 Message: 20670

I have done it with my FT-920. It is complicated because Windows XP Home does not allow certain features like Remote Desktop.

So, there is software you need to download and install such as VNC Server and VNC Viewer. This replaces Remote Desktop for control of the Host computer connected to the radio.This makes connection via internet. Then you need to use Windows Netmeeting for the Audio Communication.

Then you need to configure your computer and router to open certain ports to allow the softwares to get through.

Also you need to configure your Windows firewall to accept the connection.

Motorola announcement to acquire 80% of Vertex Standard at first reading dosen`t make cents? Motorola already knows how to make radios, real good ones at that. So what was Motorola thinking in buying Vertex Standard? Likely to gain entry into lower-price consumer sector because price-point diversification is sound business strategy. This is a way to sell radios to customers that can`t afford top-line Motorola equipment. In the market place there`s always going to be demand for low-price radios.The products offered up by the Vertex R+D team can get a product to market a lot cheaper than Motorola can . Historically Motorola places a huge engineering team on a project while the Japanese methodogly will put six guys on a project and the make the whole process much more efficient.
I think Motorola has a larger goal in mind with this purchase and only time will time what their agenda is.

It doesn't matter what their goal is. It is good old fashioned Amerikan business.

I thought that this thread was closed. It is a waste of time to discuss it because it is already happening and there is nothing any of us Amerikan sheeple can do about it.

Hello to all,If you use Ham Radio Deluxe (HRD) you can do PSK, RTTY, CW(M) etc. only by using your CAT cable CT62 and your PC, no need for any other controller or interface. It works great73 deEvert F1OQE----- Message d'origine ----De : Ken Bandy <kc9glq@...>À : FT897@yahoogroups.comEnvoyé le : Jeudi, 8 Novembre 2007, 18h51mn 44sObjet : RE: [FT897] Re: psk with 897You are correct. The CAT port on the back of the rig does not come in toplay for just digital modes. The CAT (with the CT62 cable) is used for rigcontrol, not digital comms. The DATA port is where you will connect yourRascal. In fact, it's a different connector, even. I've been using my 897with a Rascal that way for quite some time. I use the CAT port with CT62cable also, but only for rig control.73,KenKC9GLQ-----Original Message-----From: FT897@yahoogroups. com [mailto:FT897@yahoogroups. com] On Behalf Ofcherokee_muleSent: Thursday, November 08, 2007 12:37 PMTo: FT897@yahoogroups. comSubject: [FT897] Re: psk with 897Okay guys/gals I am confused again. I thought that in order to use the rig for psk31, using ONLY the CT62 would not work. I purchased the RASCAL cable for my rig from Buxcomm for this reason. Nick
Go here http://n5ztw.com/FT-897.htm
Click on the support documents link if you want to get some schematics on how to do this.
The TC+SC-YP (TiniCAT plus Sound Card Yaesu Portable)documents will show you how to build a circuit to do both CAT conversion and sound card digital mode PTT from the same serial port. I have blank PC boards and complete kits or built and tested or just use my drawings and home brew your own. The schematics manuals and drawings are open and public domain. The operation manual will tell you how to set up the radio also. Have fun with the digital modes. The FT-897 is a FB radio for digital and it is not hard to interface.

You can always change the setting of the thumb wheel so it doesn't change freq. Mine is set to adjust volume.

And yes, the mic is good investment. Would make a dandy stocking stuffer!

20681. Bencher BY 1 question

Yahoo group: FT897 (2007)
Date: 2007-11-09 22:19:24 UTC
From: n0wme
Topic: 20681 Message: 20681

Hello all
I'm trying to hook my Bencher up to the rig. The paddle has a large tip/plug on it (5mm I think) so I got a reducer that is 3.5mm but it won't stay in the key hole. It seems to push back. It is a 3.5mm stero plug according to radio shack.
Help.
Bob

Exactly which Rascal cable do I need for the data jack through a
usb/serial converter? Is the Yaesu CT39A Packet cable an option?

Tnx,

(OM) Jan Williams

Yes, I agree. Look at what happened to Heath once Zenith got their hands on it.
There has got to be more to Motorola wanting Vertex.

ve4aaz <beast@...> wrote:
Motorola announcement to acquire 80% of Vertex Standard at first
reading dosen`t make cents? Motorola already knows how to make
radios, real good ones at that. So what was Motorola thinking in
buying Vertex Standard? Likely to gain entry into lower-price
consumer sector because price-point diversification is sound
business strategy. This is a way to sell radios to customers
that can`t afford top-line Motorola equipment. In the market place
there`s always going to be demand for low-price radios.The
products offered up by the Vertex R+D team can get a product to
market a lot cheaper than Motorola can . Historically Motorola
places a huge engineering team on a project while the Japanese
methodogly will put six guys on a project and the make the whole
process much more efficient.
I think Motorola has a larger goal in mind with this purchase and
only time will time what their agenda is.

20684. Operating split on 40 & 75M question

Date: 2007-11-11 02:28:30 UTC
From: Jim Zacher
Topic: 20684 Message: 20684

I'm going overseas and need to operate split on 40 and 75M from
a rental car.

I haven't tried to set it up yet as the manual instructions
seem a little "Klunky".

Should I put my Net Freqs into the QMB or the regular memory
channels? I only need 4 sets of fres.

Is there an easier more straight forward method
of programming freqs?

Jim N9JZ

My experience too.

That hole in the rig's case is too small. Put a new jack on your key and use it without it's sleeve.

Donald.

>reading dosen`t make cents? Motorola already knows how to make
>radios, real good ones at that. So what was Motorola thinking in
>buying Vertex Standard? Likely to gain entry into lower-price
>consumer sector because price-point diversification is sound

One news site had this comment from Moto on the subject:

A Motorola spokesman recently told "The Deal" that it targets deals
in the $100 million to $150 million price range for companies that
are about to launch new technologies.

One wonders what those "new technologies" could be.

Other commentators are saying Moto did it to get better access to the
Japanese two-way market. This is probably the most plausible reason
I've heard.

Vertex has a BETTER P25 encoder/decoder and it IS the property of and made by Vertex. Motorola is buying the vocoder from a third party for the Astro product line.

Simply said, the Vertex P25 works so much better than what Motorola has. And the Vertex encoder/decoder complys with ALL of the P25 standard and specifications.

ChicagoBusiness.com says: "The spokesman said the deal will be beneficial as Vertex's sales channel in Japan and its know-how of product development could be attractive to Motorola, while Motorola 's worldwide networks should help expand Vertex's global reach."

My comment: Vertex has proven itself to be a world class radio design and manufacturing company. Mortorola has worldwide distribution. Everyone wins.

From: bobmayerau
Topic: 20629 Message: 20691

The IMBE vocoding technology used in all APCO-25 radios is owned by DVSI. http://www.dvsinc.com/ If Batman wanted to gain control of the technology they would go directly to the source. The cost of a new hardware implementation for a vocoder would be trivial by comparison.

General business, marketing considerations and perhaps a means of getting around the restrictive rules on foreign companies operating in Japan are more likely to be reasons for their proposed acquisition.

The real worry for us is that Motorola may decide that the Amateur business does not provide an adequate return or does not fit their corporate image. Remember the disparaging remarks made about Amateurs by a Motorola spokesman after hurricane Katrina.

Al, If you are running Windows 2000 or above HRD has a remote server built in that works very well. I have used mine for about two years with good results. The configuration is in the HRD docs. The audio can be done with a PSK type interface using Skype(auto answer turned on) Net meeting or even Echolink. With the HRD server you have the same screen and control as you have when you set the program up next to the radio. I would not even bother with a remote desk top program unless you have a pressing need to run some other program on your computer remotely. A few months back QST ran an article about remote control. The author used a remote desk top with HRD but he also was using a switching program to switch antenna in the shack. HRD can do that too, but I have not tried that function. He did make a very good point, any time you are running a remote set you FT-897 TX time out to three minutes or less. He also talks about using no_ip.com to forward to the remote port. It is good reading If you have questions contact me off line direct and I will try to talk you through the HRD setup.

Al.

IF you are using Windows XP Home Edition, Remote Desktop does not work. Remote Desktop only works with XP Business. If HRD overcomes this problem, then go with HRD.

Netmeeting works well.

I use VNC in order to put my Host Desktop onto my Remote Computer. Just like if you are sitting at the Host computer. You can then answer the Netmeeting incoming call remotely.

If you have DSL or Cable Internet, you need to use no-ip.com in order to get through the Dynamic IP system used in DSL and Cable Internet. no-ip.com keeps track of your changing Dynamic IP address.

You will also need to open appropriate ports in your Cable/DSL router and Host Computer to allow the connection to get into the Host.

Best Regards
Dan Schaaf

Gene and All,

Actually, that's not a very good example. Zenith was struggling mightily when it acquired Heath. It didn't help! So, both entities actually bit the dust. Zenith probably was trying to strengthen it's diversity, or something like that. Any of us who were around in the 40's and 50's know that Zenith was a household name. TV's and Radios were their flagship products. But the computer age caught them with their pants down. They tried to make computers, but it didn't work for them. I had one (my first laptop), and it cost a bunch. Remember, Heath had some retail outlets as well, so that may have been part of the attractiveness for Zenith.

Anyway, Zenith is no longer around, or is someone else's in name only. I'm not even sure there are any products being sold under the Zenith name anymore.

Motorola is vastly different that Zenith. It is a relatively strong company with a broad product line. There is plenty of reason to assume that acquiring Vertex is a "nice fit", and there is no really good reason, at least at this point, to assume that Motorola doesn't want to expand Vertex rather than contract it.

20695. SSB peak output too high?

Yahoo group: FT897 (2007)
Date: 2007-11-12 16:18:32 UTC
From: wa3jpg
Topic: 20695 Message: 20695

I haven't used my 897 in some long time now (busy, 817 in the park, etc). Several years ago, my 897 went in to Yaesu for parasitics and a power adjustment (it was putting out just under 90 watts, I asked Yaesu to set it to 100 so I could drive an amp that needs that).

It came back without parasitics, and the CW output sits right on 100 watts now. My station power meter is a NYE RFM 003. It has an active circuit to read PEP.

I notice that when I set the 897 SSB power to 100 watts, on normal voice peaks I get up to 140 watts PEP reading on the meter. If I set the SSB power lower (the internal menu), I still tend to get very high PEP readings on normal voice peaks until I get down to the 30 or 40 watt range, but even then, if I speak loudly, the meter says I'm putting out a lot more power on peaks than I should.

My meter seems to work fine, I tested it on several other SSB rigs and the peak reading function reads normally (around 100 watts CW on these rigs and SSB normal voice peaks show around 100 watts PEP SSB with my Ten Tec OMNI VI and my Kenwood TS 440) so the circuit does not seem to be faulty in that respect.

My supply voltage is normally 13.5 vdc (Astron 35M). I've tried both hand mikes I have and the PROC on and off. Still the same problem. Same problem into dummy load or into tuner at low SWR.

Anyone ever see this problem? Poorly adjusted ALC? I am a bit concerned to run it very much because I suspect it strains the output circuit a bit each time I hit it with these high peaks. I'm looking for advice here before I ship it back to Yaesu for them to have a look. Thanks for any thoughts.

20698. psk solved

Yahoo group: FT897 (2007)
Date: 2007-11-12 17:45:25 UTC
From: patecq
Topic: 20698 Message: 20698

another example of a simple solution. i was able to get 2 friends on the local repeater with my HT while tx on psk with nothing on their screen.
the ham who also had a ft897 said the radio should be in USB.
I was in DIG,as thats what the manual said to do and there was a PSK USB selection somewhere in the menu. the manual did not say go back to USB. after that they could hear me.
thanks for the suggestions. 73

20699. RE: [FT897] SSB peak output too high?

Yahoo group: FT897 (2007)
Date: 2007-11-12 18:46:12 UTC
From: dalite01@bellsouth.net
Topic: 20695 Message: 20699

If you set your Output Power to 100 Watts, Mic Gain no higher than 22, no processor, you should get what the set will cleanly make as far as power is concerned.

Easier than that, set the meter to ALC, Output to 100 Watts and adjust Mic Gain until the ALC just starts to register. If you go much higher than 20 on the Mic gain, you are making distortion. The factory setting of 50 grants you an invitation to leave a roundtable in most cases.

I run a FT-857 D mobile, and a FT-897D in my portable rack (Voice, Sound Card Digital modes and Pactor III for Airmail), Neither are ever run higher than 22 on the Mic Gain, neither run processor, and both are usually set to 100 watts output. It works, and you get what the rig will put out cleanly.

It sounds like the ALC is too high (too much Mic Gain and Processor) and that anything over 30 to 40 watts output power, at those settings is just getting wider, not more powerful.

The beauty of metering devices is in terms of their bandwidth and movement type. A non-powered (spring return) meter movement will never read true peak power. A powered meter movement will, as it can be electronically returned back to zero rather than relying on overcoming mechanical return (spring).

The down side, the more bands the meter will work on, the less chance it has to show if all your power is being generated harmonically or on the fundamental frequency. 30 MHz of Bandwidth on a band plan that covers somewhere around 7 MHz of usable spectrum introduces a large chance for error.

If your run any of the digital modes, the person at the other end should be able to help you set things up, as they will be able to "see" your signal and tell you when it is too wide, or just right. You can apply that info to your voice usage, and determine the max settings to allow a clean signal.

Just some thoughts,

David

I must disagree with that. If I followed that advice on my 897 the peak output would be nowhere near 100W. I have to get somewhere near 1/2 scale on the alc meter before there is 100W peak o/p. That is on single tone into the mic socket.

I can only go with what I know on this.

However, I should have been more specific; tying ALC to digital output and Mic Gain to audio output. That would have put things more into perspective.

When looking at the signal at the other end (through screen shots captured and email and via first hand reporting), increased ALC means wider signal. It is easiest to see when decoding digital signals.

22 is the magic number for voice, for good quality audio.

Folks will attempt to listen to any signal that can provide any information, if the information is important to them. However, for record traffic, having to only say something one time is not only priceless, it can save lives. Its that old speed vs. accuracy debate....

If you do all the published mods to the Mic amp and processor, you can get them to work properly, and run higher Mic gain and speech processing without diminishing speech quality. However, out the box, Mic gain not to exceed 22 for voice, and ALC just registering for digital will give the cleanest output and best chance to get the traffic through on the first attempt. Anything else is just spectral clutter...

If you feed signal in through the data jack (complex, 2 tones, not harmonically related), and view the output, you will soon see where things start to come apart, and any increase in perceived power equals exponentially increased spurs.

David

Hi Bob! Good to see you out here, heck, you helped me numerous times back a couple of years. I'm still grateful.

Yes, I use a NY RF Monitor, active peak reading circuits, equal in accuracy to the ones you mention (when calibrated regularly, don't ask me when I last had it calibrated!)

I tried the lower mic gain (but, of course, ALC should limit SSB peaks to 100 watts even if it goes too high...) and it did not change the readings. In fact, when I lower the SSB power to 50 watts, I can still speak into the mic for a few seconds and my meter will read up to 140 watts peak (with peak and hold circuit engaged to catch such peaks.)

My other rigs don't push this meter up so high even with the same load, etc, so, while I am certainly open to operator error or meter fault, it does not seem to be the case here. Probably off to Yaesu, was just hoping someone else had seen this problem and had a suggestion. My suspicion is that something in the ALC circuit is problematic for SSB. CW power output tracks the internal setting just perfectly, but SSB results in little bitty peaks that go real high as far as I can tell.

I was using a Bird 4391, which has both cw and peak readings. It you read my post correctly you will see that my measurements were done on single tone, which equates to cw. The same results are observeable on speech, and tie up using a scope, on the Brid, or even on the 897's own power out display; a small ALC indication equates to low o/p power. In order to get 100W peak on my 897 it requires signfiicant alc to be displayed. However, this does not cause distortion, and the signal sounds clean, both as observed in the shack and reports from local stations.

If I used a mic gain of 20, and did not shout at the mic, I would only get about 30W or so peak.

We've been using Teamspeak on VE7GL's Icom 756 Pro. Should work
on an 897D.

Hello Jeff and KC3VO - I would think that
(and I am not certain) it would be very
unlikely that one person could use a specific
number to set a mike on one radio and then
dictate that number would be ideal for another
radio and operator, if the internal menu settings
by Yaesu vary as much as they do from one rig to
another. It seems there are no two radios issued
new in the box with all the same settings and the
individual voice and operators habits could vary
widely. Albeit, one operators settings should be a
possible starting point from one station for another
to work from - Dave / NØATH

From: Jose Luis Fonseca
Topic: 11374 Message: 20709

Hi

i have a 857 and the cat connection not work.
I bought the radio new and it work until last 3 weeks.
after that nothing. I already try a lot of softwares and tecnical thinks but nothing
the same error all the time, can't read frequency.
anyone have ideas ?
i think is a eprom problem ?
anyone can copy all the eprom parameters and send to me by mail ?
you can do that with a software like supercontrol.
you read the eprom, save to disk and after send by email to me.
i will try it and let yoou know the results.
ham regards

The author of the first thread below is correct. Mic gain should just barely register on ALC. Power output will show approximately 30 watts or so even though you are actually putting out 100 watts.

It's the nature of SSB.

You obviously did not read my post correctly, or you would have noticed that I stated that the observations of low power when there is a small ammount of alc registering were also true when a single tone was applied to the mic input.

A single tone equates to a cw carrier "it's the nature of SSB".

Hi All,

Unfortunately the ALC meter on the FT897 is not a good indicator, so
if you set the mike gain so that the ALC only occasionally registers
on speech, the average output power will be quite low.

See FTALC.pdf in the files section for details.

Regards,

Martin - G8JNJ

20724. Re: SSB peak output too high?

Yahoo group: FT897 (2007)
Date: 2007-11-15 00:53:52 UTC
From: vr2ax
Topic: 20695 Message: 20724

I checked my 897D on the 'scope last evening just out of interest. I was testing something else when this series of posts came to mind. My 897D is new, two weeks old, stock hand mic, stock default factory settings, no processor as far as I am aware, have not located the menu setting for that yet.

897D running "100W PEP" on 14Mhz USB into a dummy load. Carrier output measured at just under 100W on a Bird 43. Test gear, Instek 35Mhz analogue scope, sampling approx. 0.2V RMS of RF, measured on a Fluke 189 with 85RF probe, through a Bird "sniffer/attenuator". Normal speech, for myself.

I was able to detect slight "power spikes" on the leading edges of each series of speech. Obviously, this should not be regarded as definitive, as a storage 'scope would be necessary for proper evaluation. However, judging by my eyes alone, I would estimate that the "spikes", measured in voltage terms on the 'scope display, were around 10% - 15% above the flat or carrier (or whistle) level. That suggests a "spike" in power terms, of around 20% - 30%.

The "spike" would disappear or settle fairly fast, and then reappear again after a pause in speech of a second or two. Although this is purely a guess, it may be that the ALC circuit in the 897D has a rise time that is too slow.

The above is very empirical, although further testing may be worthwhile.

Wyn, VR2AX

From: wa3jpg
Topic: 20695 Message: 20725

Wyn -

You know, I was imagining that this is what was happening. I have used the standard, cheaper PEP reading wattmeters and only read 100 watts PEP. My NYE RF monitor has an active circuit and a "peak and hold" feature. When I read "peak" I watch the peaks hit 100 watts or a little over that. When I read "peak and hold" I can watch the peak raise a bit at a time as I speak, till it hits 140, sometimes 150 watts. Little spikes would explain that. I do recall that the 897 was problematic for my Ten Tec Hercules amplifier (that is sensitive to overdrive) on SSB but not on CW. Anyone else have nice, sensitive equipment to check on this pheonomena?

I suppose such little spikes are not really dangerous to my output circuitry, so I'll keep on hammin'

Indeed you need the sound card, but if your computer can run HRD it is a modern computer with a sound card. I just wanted to point out that for doing PSK31 wit a FT8*7 and a computer you need:
the FT8*7 rig,
a YAESU CT62 Cat cable,
a PC WITH sound card and Let's say Windows XP as OS
and of course HRD
The fact is that you have to read how to configure DM780 (topics in HRD site explained when doing the download)
But I will make an other topic with the settings for the FT897(D) Rig as well as HRD (promised)
I don't have a lot of time these last days

Clark,

You can never be sure. I would be watchful of (a) any solid state amp (I know of at least one PW1 that went down from a similar problem in an ICOM exciter)(2) Modern microprocessor controlled, especially tetrode amps, such as the Alpha 91b seriers onwards. The former are more likely to go pop, the latter just keep tripping out with any drive spikes.

Older amps, like my L-4, will probably experience momentary flat topping, some minor IMD products will be produced. Only ultra clean tube amps, such as 3cx800a, will suffer noticeably.

Thanks Wyn. I've since let the Hercules amp go, picked up, you guessed it, a Drake L-4B that has sat for many years. Power supply rebuild will be first, then I'll look around - but there's not much to go wrong with the rest of the amp, hi hi. I have some spare 3-500's (maybe even some 3-400's) around here somewhere.

What strikes me is that before Yaesu serviced the rig for parasitics and raised the output (by a mere 10 per cent, from, what I measured at 90 watts PEP on SSB OR CW), my NYE RF monitor read the same power peaks for SSB and CW. Now they are very, very different, so I suspect something in the ALC has been affected in some small way so that the attack isn't as fast as it ought to be. I don't think I'll find that one, though, so at some point (maybe soon) I'll have Yaesu have a look at it.

20734. SETTINGS [FT897] Re: psk with 897

Yahoo group: FT897 (2007)
Date: 2007-11-16 22:49:40 UTC
From: EVERARDUS VAN T HULL
Topic: 20730 Message: 20734

As promised I will give you here the settings as used with HRD and my Yaesu FT897D

I use
Packard Bell computer:
Processor P4 CPU 3.06GHz
RAM 1Go
System Windows XP2 SP2
I use the inbuilt soundcard Realtek HD with amplified speakers

Tranceiver:
Yaesu FT897D and Yaesu CT62 CAT cable on PC Serial port 1
FT 897D Menu Settings:
001 ON
015 0Hz
017 0Hz
018 0Hz
019 38400bps
020 CAT
036 0Hz
037 50
038 PSK31-U
039 0Hz
045 240Hz
046 160Hz
047 5520Hz
048 OFF
059 NOR
068 MONI
074 75
075 30
081 95
085 OFF

HRD DM780 SETTINGS:
Soundcard Auto
Options (Input)
Device: (Mysoundcard) Audio input
Source: Mixage Stereo
Auto gain control v
Default sample rate 8Khz
(Output) v use input device
Source SPDIF
Output Attenuation 0db

When HRD starts the controlpannel display has to be configured in 38400Bps and the serial port has to be set to automatic select

The mode on the radio has to be set into USB
When by transmitting you will not see any or pour signal on your FT897, try to increase the amplified speakers volume
I hope that this information will help in starting with BPSK31 with HRD DM780

Best 73's from Evert F1OQE

From: vr2ax
Topic: 20736 Message: 20736

Reflections of some experiments with a homebrew "FT-Meter".

Cost of buying one and shipping from the US is around $80 at the new USPS rates. They look nice, but 'a meter is a meter'.

As measured, "FS" or full scale calibration signal = 1.04 mA; and also 4.97V open circuit (Fluke DVM).

Bought a 1 mA meter (70 mm W x 60mm H), it was good at 1mA full scale, deemed a calibration circuit to be not worth the effort. Printed out the nice meter chart from the internet.

Posted photos of end result under my call in the photos section of this group.

It works. Follows the internal readings in the 897D fairly closely.

How accurate is it? No better than the internal 'meter'. My white noise generator registers S 8-9 on the meter, it is actually around a 1.25uV or -107dBm signal. I guess the S meter in my 897D is generous. Attenuator (supposedly 10db) reduces the meter reading to zero, IPO setting reduces by only "2 S points". No sensible correlation.

Was the experiment woth it? Cost of meter $5, cost of case $0.90, hardware, about $1, time 1 hour. Definitely.

Sounds very good and in the true amateur spirit to roll your own.

However, when you set your meter did you have the AGC on, because
10dB should be just over 3 S points and S9 approximately 50uVPD
on HF bands.

If you have (access to) a "calibrated" signal generator, you could
carry out a calibration of the S meter, using the recommended
3dB/S point and 50uV as S9. Do not expect the meter to be accurate
though and bear in mind that above 30MHz, 6dB/S point is the
recommendation.

Geoff,

Thanks for your comments. Had AGC on. With off, no meter reading was registered.

I have no 'calibrated' signal source at this QTH. However the Elecraft N-gen is good to +/- 2db. I tested it a while back against my IC-R9000 at another QTH, it gives a fairly consistent S 5-6 noise reading. I have also checked my IC-R9000 against my Marconi 2019 signal generator (not calibrated either, but got S9 = - 79dBm at 520 Mhz, or about 25uV) on that. I have concluded that some form of calibration is desirable. Otherwise the meter is just a visual aid.

As has been noted here many times before, the S meter on the 897 is horribly non-linear (or non-logarmithmic if you wish). It bears no similarity to the above definition of S meter response. Any atenpt to calibrate it would result in a very odd scale!!

20740. Noise on transmit

Yahoo group: FT897 (2007)
Date: 2007-11-17 13:54:00 UTC
From: lm3ri
Topic: 20740 Message: 20740

I have had an on-going problem with my 897D. On transmit, upper or lower sideband, without any mic gain, there is a very pronounced noise that sounds like a fan with a bad bearing. The level does not change regardless of power setting, or even if there is a mic hooked up. On FM and AM, the sound is minimal. Radio is stock, I even did a general reset, and still the noise persists. Any thoughts prior to sending the radio back for repairs? By the way, I put the 890 in line, same power supply/antenna, etc. and there is no problem.

Thanks!

Hi Wyn,

OK about the Elecraft Noise Generator, I am sure that the 2019 is
also good enough even though not "in calibration" and the figures
obtained on the R9000 seem to be well within acceptable limits. S9
at 25uV, i.e. +/- one S point seems to me to be much better than
many amateur tranceivers.

What did surprise me was the difference in meter readings you
obtained by inserting a 10dB attenuator, from FSD to nearly zero
seemed quite aggressive. Of course, the input impedance of the
FT897 may have an effect! Sounds more like FM than a amplitude
linear mode!

Being a primarily weak signal VHF and up operator I tend to ignore
the S meter and estimate signal levels as dB above noise - but as
an ex-calibration engineer, I still like things right!

Perhaps one day, I too will roll my own S meter, but I have a few
other projects to finish first.

Hi Leeds,

Nice to hear you on the 75 meter group the other day!

What you are describing sounds very much like what several others have reported at times. It is believed to be clock noise or processor noise from the DSP unit that is the result of different ground paths from the DSP unit and the main board ground.

An article was published at the dk mods site called "TX noise, RX birdies for Yaesu FT-897D" that seems to eliminated the problem by simply forming a solder bridge from the DSP ground to the common main board ground. The modification also appears to eliminate several birdies on receive as well. I have not done the modification, but Jochen DG2IAQ reports very good success with it. The most difficult part of this project is removing the main board from the 897D which is not really difficult, but requires patience and careful labeling of the various cables and wires that you have to disconnect.

http://www.mods.dk/view.php?ArticleId=3845

Some people have indicated that the problem is greatly reduced by simply running with the DSP MIC EQ (menu item 048) set to OFF. My unit is always run that way and that might be why I have never really heard the noise, but I do suspect that this issue varies from rig to rig.

Good luck!

Rob WB1AEX

I've had the same problem and choose to send my radio back to Yaesu to have it repaired under warranty. They also re-adjusted the biases which you will discover are way out-a spec.

Here:

http://www.radio-foto.net/radio/ftmeter.php

I came across the link by searching within this group. There are
some quite good resources here.

I printed out the 'orange' one. The full size is a bit short of A4.
I have superimposed the meter scale on it, just for cross reference.
I may get it laminated in clear plastic for extra durability!

From: vr2ax
Topic: 20736 Message: 20747

Geoff,

That was using the in-built attenuator in the 897D. I also tried using an external 20db attenuator. The effect was even more pronounced! The N-gen produces nominally -107dBM in 2.4khz bandwidth, the noise was very clearly audible on the 897D speaker with 20db attenuation in line, so I guess the noise floor is below -127dBm. When I added in the in-built attenuator, ie effectively a -137dBm noise signal, I could just barely detect a change in audio level from the speaker, as the generator was switched on and off. So I guess the noise floor is somewhere in the range -(127-137dBm). Interestingly, switching in the IPO setting instead of the ATT has a less pronounced effect. Presumably that would mean that the pre-amp is low gain, and most of the gain of the set is in the IF stages?

The R9000 (at my UK home) is a very sensitive receiver all the way up to 2Ghz. The 2019 stops at 520Mhz, but the R9000 can hear the noise from the N-gen to over 1Ghz. The N-gen is only specified from 100Khz-500Mhz, and where my UK home is located, there seems to be very little RF activity in the 1-2Ghz range!

Hi Wyn,

Well, if the FT897D's rx is around -137dBm, that is quite good for
a HF receiver, given that the noise floor on 2.4kHz is ~-140dBm,
perhaps I will put mine on a noise system and measure it, although
I am more interested in 6/2m/70cm. It is sad that the S meter is
less than accurate, perhaps some measurements there too!

This discussion is provoking more interest in searching out a 1mA
meter and getting my sheet metal worker friend to make me a case
for it.

BTW, the 2019 should go to 1040MHz....

Geoff and all,

Yes a very useful discussion with you all. I was wrong about the 2019, it is actually a 2018. I had to check my database and look at a photo of my hard drive to remind myself as it is at my UK qth. Covers 80khz-520mhz. I also re-did my check on the noise floor of the 897d, as measured on the N-gen, with a couple of attenuators. I would estimate -137dBm as detectable in noise difference copmared to a dummy load, maybe slow cw would also be copiable, but for reliable copy I would add on a few db.

I used a cheap circular saw hole cutter and a power drill to drill a 2" hole for the meter in the thin alminium front panel of the meter enclosure.

From: Kerry Winer
Topic: 20740 Message: 20750

Hi Leeds,

I am quite familiar with the FT-897D TX SSB noise. I always found it interesting why FT-897D's had such good FM audio & poor SSB audio. The TX SSB audio has the characteristic noise and also sounds like you are talkng thru ahollow tube. The reason is that Yaesu has the SSB TX audio routed thru the DSP. The DSP algorithm is not setup properly to handle the TX audio. The DSP software was basically designed for RX audio processing.

Having said that - If you are able to make a mod you can vastly improve the TX audio. A friend of mine recomended this modification.....I have also made the mod and it works very well. The mod involves removal of the main board to get to the bottom side. The work involves removal of a small chip capacitor (C1446) and routing TX audio line at R1393 around the DSP by adding a 1" short jumper to the circuit board between C1505 and the R1474, R1457 voltage divider.

You will not believe the SSB TX audio improvement.

Regards,

Kerry K8KSW

I plan on buying the Yaesu battery packs for remote operation and have one question for the group.
Can the radio be operated from a power supply when operating from home QTH at full power with the batteries installed or do they have to be disconnected first? Does the radio sense the power source?

Thanks
John

Good work!

I have a 200uA meter with a 50K pot taped to the handle of my 'tape measure yagi' that I have used for hidden transmitter fox hunts. Having the external analog meter output was an unexpected feature when I bought my FT-897! What a cool feature! It is so much easier (for me) to move the yagi around and watch an analog meter needle than to try and interpret a bar graph. The rig is a bit heavy for on-foot fox hunts, but I have a shoulder strap that clips onto the handle that has helped. This will also be helpful for hand-tracking the satellites.

I didn't think I would care for a meter at the base station however, since I expected to be using Ham Radio Deluxe to control the rig. As it turns out however, I bought the LDG meter for the base and couldn't be happier...not quite in the same ham spirit as your hombrew however.

cheers and 73,
Dave KI4PSR

John,
The built-in power supply (FP-30) fits in the same cavity that the batteries do. So you can't have both mounted at the same time. That being said, there is nothing that prevents you from operating on an external power supply with the batteries installed. The unit is intelligent enough to run off an external source if it's available. You can still charge the batteries with the CD-24 when it's connected to mains, as the batteries have dedicated connectors on the back of the radio.

I can't speak about the IC706GMK11 rig but I can talk about the 897D and the 857D as I own both. The 897 and 857 have the same internals. For a portable setup the 897D is an excellent rig. The 857 is much better for a mobile setup. I have had 100's of QSO's on both rigs. Are these rigs the best rigs ever, no. Are they a great bang for the buck yes. If you can afford a better rig like an IC756 pro iii get that system instead. If you only have X amount of money and want a radio that can do a good job at everything this is the radio you want.

One last thing the 897 for most mobile setups, isn't the right radio, go with the 857D.

I have had my 897D for a couple of years now with excellent performance. I have talked around the world barefoot with a homebrew G5RV. It lacks some bells and whistles I have seen on others, but performs just as well as any I have used. I also use it for many digital modes with great success.

For the money, you can't go wrong. If you are looking for bells and whistles, and have the money to get them, you may want another radio.

Let me know if you have any other questions,
Thanks, - Adam - KD8CCX

20761. RE: [FT897] Possible purchase question from a new member

Yahoo group: FT897 (2007)
Date: 2007-11-19 05:12:35 UTC
From: dalite01@bellsouth.net
Topic: 20757 Message: 20761

I have both the FT-857D and FT-897D. As others will tell you, they are the same radio electronically.

When properly setup for the Mic you are using and your vocal traits, they perform as well as anything available in the price range.

I also have an older FT-100 (not D), which has a little larger display and possibly a bit better on the receive. However, it has quirks and design differences of it's own.

I cannot address the IC-7606 Mk IIG. We have one at our 911 Center station. It is primarily used for digital operation for Airmail using the SCS controller, and while I have operated it both digital and voice, I haven't had to work through interference with it, and cannot judge it against the ones I have used more often.

I also use a Kenwood TS-2000 for home use, and it has features comparable to it's price range that make it more enjoyable to operate under noisy band conditions. I run voice and digital on the TS-2000; mostly for Army MARS use.

I also run voice and digital on FT-897D, which is installed in my Go Kit along with a MFJ Sound Card interface connected through the Mic Jack and a SCS Digital Controller connected through the Data Connector on the rear. It allows me to quickly set up a station to handle voice and digital traffic in a easy to transport setup. I have a USB to 8 Port serial interface in the go kit, and I keep the CAT connected to it, as well as the sound card interface and SCS controller. It allows me to connect the laptop to it and have computer control of the rig, keying on the sound card interface and the SCS controller. It also allows me to program radios in the field so that all rigs are coordinated with the same operating frequencies in memory.

Here is a link to the Go Kit: http://www.se-hams.com/html/emcomm1.html

One weak point on the Yaesu FT-8x7 series is that there is only one CAT port. It can control the Rig, Tuner or Linear..... One at a time. There are a few work arounds to offset this shortcoming, but it is worth mentioning when someone is considering purchase.

I use the MH-59 remote Mic in the mobile on the 857, and it adds a new dimension of operation from the Mic. It is a good addition for either rig. After you remove the plastic diffuser between the Mic element and the opening on the front of the Mic, the audio becomes quite acceptable.

A well known commercial meter box manufacturer uses 500uA instruments
with a shunt and and a pot to adjust full scale sensitivity.
With common deviations in meters, resistors et all,
being able to adjust this seems a good idea.
There is even a menu setting to adjust full scale.

The commercial meter looks very nice. The price, at least overseas,
sucks rocks unfortunately: Typical USA price is $45,
list price in the Netherlands is (converted) $86,
so it's worth shopping around if you want the commercial thing.

From: Gene Horr
Topic: 20757 Message: 20763

The reviews are bunk <g>. Considering that the 857 and the 897 are the same radio inside...

For HF IMO all of these units are par. I think that you would be happy with any of them for this one criteria. For mobile use though the 897 is not a good choice in my opinion due to the user interface and size. For mobile only I prefer the Icom products.

Subject: [FT897] Possible purchase question from a new member

I am thinking of a purchase. I am not sure as I have seen quite a few negative reviews for the FT897D. i.e not good on HF and that the 857 or the IC706GMK11 are much better.

Would appreciate any honest comments.

Hi there i have had my ft-897-d for 3months now and find it to be an amazingly competent hf trx. I have previously owned or sitll own
ft767gx hf
ft817 hf
ts820 hf
ts440s
ic751 hf
and find that the ft 897d has a much more sensitive rx and the tx audio is far superior amongst outher things of course if i can help in any outher was maybe if you have a hf set i could give you a on the air demo if you would like to organise a sked

73s for now de 2e0njk nick www.qrz.com for details

From: ldgelectronics
Topic: 20736 Message: 20765

Wow, that's a pretty good scan of the FT-Meter face. I like how he changed the colors.

That will probably put an end to the debate if it's moral to copy someone's work and publish it to the newsgroups (tnx Wyn).

One thing to note for those that are going to build their own, is that unless you have the same meter, you will get non-linearities due to the angle difference from the pivot point. Obviously, this does not have to be exact, but the farther away you get, the greater the error will be.

20766. MC-60 / Adonis or other pre-amp mike

Yahoo group: FT897 (2007)
Date: 2007-11-20 09:55:07 UTC
From: f5alj
Topic: 20766 Message: 20766

Hi All,

I have the following problem: My modulation is unreadable with pre-amp mike!

- Modulation bargraph is showing few little bar,
- Power bargraph shows power from 0 to 30watts
- ALC bargraph shows a lot of bars or no bars (like 0 or a high level)

Configuration : FT-897D - 30m of coax - 8m long wire with magnetic balun at 30m above ground and MC-60 microphone.

- Mic Gain (Menu-060) : 4 to 6
- Comp On or Off (Menu-74) : 30 to 50
- RF Power (Menu-75) : 20 to 75

I've tried some different microphones : Adonis, Tuner 3B, (same results)

Does someone have any ideas ?

Thanks for reading.

yeah I had the freq changing problem also, but setting the wheel light to green by pressing that button next to it
changes it to a handy volume control. That's what my mic is set to.

I have a MH-59A8J Microphone and like it. They do have an issue with being

susceptible to RF getting in, but a torroid core just inside where the cord

enters the mike takes care of the issue. I also have the thumb wheel covered

with tape; it seems that every time I talked I changed the frequency with my

thumb..

20768. First fix for loss of CW

Yahoo group: FT897 (2007)
Date: 2007-11-20 15:13:42 UTC
From: dennis
Topic: 20768 Message: 20768

I had to wait to get my rig returned from Yaesu to start this project.

Here is my first attempt to fixing the problem related to the loss of CW keying. The idea was to keep the lines short and provide isolation between what is in the radio and the outside world. This is a proof of concept circuit design.

The IC is a dual opto isolator MCT6. This is a surface mount type in a standard DIP package. I used two additional 1k resistors. The 13 volts came from the CAT/Linear jack. The construction is manhatten style over a groundplane.

If this proves to be successful, I will make one using SMT components and mound it inside of the radio.

If there are any questions or ideas on this please ask.

Pictures are attached.

Have a similar problem with my 897D. The ATAS 120A will tune with radio with "tune" button, but manual "up or down" tune will not respond. Sometimes you want to tweak the tuning and I thought that was what the manual "up or down" was for. Is there a special menu option you have to select in order to have it manual tune?Gary

I think you'll find you need to be transmitting to adjust the manual tune.

Try switching to FM or CW so you have some signal power for the SWR meter, keying the mic, and then pressing the up and down keys.

Did you wire the mic up yourself?
I've had problems with my pre-amps mic mixing the power ground and mic
ground. The audio had RF in it on certain bands. It took some circuit
mods and an isolation transformer to fix it.

Also, Becuase of the lower levels of driving a transformer, I have to
run my FM and SSM mic gain high. Both are about 75.

Tnx for your answer.

Yes, I have wired the mic myself and ground shield is different from the ground mike.

But I certainly have RF return in the pre-amp from ground.
I have a Yeasu mike MD-200A8X and it is able to work correctly, I would like to use other mike like MC-60 but it does'nt !

I'm trying to find a solution but if you already have one please let me know.

20774. FM Sensitivity

Yahoo group: FT897 (2007)
Date: 2007-11-21 00:44:14 UTC
From: Lee Jorgensen
Topic: 20774 Message: 20774

Howdy all ...

Been lurking on this forum for quite a while, and recently needed to do some fox-hunting. Fortunately, I was given a chance to take my FT-897D out and track down the noise (which I did, down to the location in the building where the source was, but that's another story).

Anyway, to prove that the FT-897D was more sensitive than what we were using in the past, I had a chance to put it on an Aeroflex 2975 Service Monitor, that our company just received.

I took the opportunity to check the scaling of the built-in S-Meter, and remember, these results are for VHF - FM Wide.

The squelch broke at ~ -128dBm (0.09uV)

S1 = -113 dBm (0.5uV)
S2 = -111.5 dBm (0.615uV)
S3 = -109.5 dBm (0.75uV)
S4 = -108 dBm (0.825uV)
S5 = -106 dBm (1.1uV)
S6 = -104.5 dBm (1.5uV)
S7 = -101.5 dBm (1.9uV)
S8 = -101 dBm (2.0uV)
S9 = -98.5 dBm (2.6uV)
S+ = -97 dBm (3.2uV)
S++ = -91.5 dBm (6.0uV)
FS = -88.5 dBm (8.5uV)

How I was testing, was sending a 1kHz tone from the Service Monitor directly into the VHF antenna, and was adjusting the value until the display changed. From about S1 to S7 seems pretty linear as far as dBm goes .... I was using microvolts to measure, and in the table above, approximating the dBm level.

I was also pretty impressed, the transmit power is about 2-3 watts lower than the reading on the display. For instance, at 100 watts, I was measuring about 97 watts (HF, FM Wide). Also, was able to measure the frequency, and found that I was about 100 Hz off, which may not sound like much on SSB, however, since I normally run digital definiately explains some "drifting" signals I've been seeing lately.

For comparison, the Motorola radios that I normally bench run about 0.15-0.2 uV to break squelch, the FT-897D was doing it at 0.09uV. However, our receiver for the fox hunting equipment runs around 0.4-0.5 uV ... not good.

All in all, I was able to impress people at my work that used to think "amateur" meant "not sophisticated" ... however after these tests, I was able to prove otherwise.

-Lee.
n0wq

PS, yes, I was able to find the noise, and was able to even tell where in the building the noise was coming from. After we pulled the device (found out it was a radio-based alarm system), the interference to the Fire Dept channel disappeared. The curious part, is that the frequency is different than we were tracking, so I believe there was another transmitter around mixing with this device. After pulling the device, the noise has not returned in about 2 months now.

My bad ... just re-read my notes that I took while testing the FT-897D
.... I was only 10 Hz off frequency, instead of the 100 Hz that I wrote ...

20776. best auto tuner?

Yahoo group: FT897 (2007)
Date: 2007-11-21 02:46:25 UTC
From: Dan Evans
Topic: 20736 Message: 20776

I'm planning to buy or trade for an auto tuner soon and would like to hear some opinions on the current market.

I'm leaning toward the LDG AT897, but I've heard some folks say they prefer the AT-100.

My primary use for this tuner would likely be for portable use. Typically, I'll throw an 80 or 40 meter dipole in the tree tops and "hopefully" tune it for all the higher HF bands. I normally use resonant antennas for 6 meters, so that shouldn't be much of an issue. Max power is the 100 watts from my 897D.

Thanks,

73
Dan

I can tell you Dan, the AT897D is an excellent tuner. I have had one for about a year now, and have had no complaints. I know that 2 people in our club that have the AT100, and wish they had mine. It is just a joy to use, and performs excellent.

Just my 2 cents!

I'm using the LDG Z-100, and am happy with it.
It's small, and only draws any power when it's doing the tuning cycle, not the rest of the time. It connects to the 'ACC' port of the yaesu 857/897D, so that when you push the 'tune' button on the tuner, the radio automatically sends a carrier until the tune is complete. Nice and easy.
It tunes up the various random antennas I've put together fine.

Hi Jean.

> - Mic Gain (Menu-060) : 4 to 6

First of all there are several MIC GAIN settings, one for AM, one for FM, one for SSB. You have to check all the 3 settings in the menu !

Then the settings go from 0 - 100.

So if you didn't had a typo (above), your setting of 4 - 6 is WAY TOO LOW ! Raise it to the standard setting of "50" for all these 3 mic gain settings.

And reduce the level on the microphone instead ! The reason is that the 3 electronic mic gain settings (above) work BEHIND the 1st internal mic gain stage of the FT-857/897. This means that if you overdrive the internal mic gain stage by the preamp-mike your modulation quality would even be worse if you reduce the electronic mic gain level behind this stage. The 1st mic preamp is still overdriven and causes distortions !!!

BTW - a preamp-mike is usually GENERALLY TOO MUCH STUFF for a FT-817/857/897, cause their mic input is designed for the low levels of dynamic mic capsules.
In the case of using a preamp-mike anyway (for what reason ever, cause it has a great sounding electret capsule, or a compressor stage, or a rogerbeep or echo effect, ..or whatever) its output level HAS TO BE REDUCED down to a level close to simple dynamic capsules. Simply by the volume knob, or if this is too tricky, by adding an output level devider (resistor attenuator stage).
Otherwise the result only CAN BE WORSE with that rigs.

73,
Jochen (DG2IAQ)

Dan, instead of dipoles why not use a single wire and a (wrongly unfashionable) FC40?

A year ago I installed a colinear for 2/70 and a long wire tuned by an FC40 for the PL259 socket, and am very happy with results. The FC40 is effective and effortless.

The only HF band that doesn't interest me is 80m - so I made the wire about 40m (ie a half-wave at 80) with a 20m counterpoise, and 80 is the only HF band of the 9 that the FC40 will not instantly tune.

I agree. From what Jean describes, those setting are low.

What I'm trying to do is two things...

One... Use a passive noise canceling mic-headset such as the Telex PH-3R5 Headset. This has a mic that one literally has to be close to be heard. It's designed for TV cameramen in large stadiums to reject the stadium noise but yet make the camera person heard. The problem with ham commercial mics as well as the factory mic is that they seem to pic up about everything in the house! The fridge, the wife watching TV at the other end of the house, dogs barking outside, everything! Unfortunately, this mic on the telex headsets has a low output and a mic preamp is needed. I'm also working with a noise gate proc amp

Two...
After reading a few articles about how the ALC in the RF section of the FT897 is being used to compress the audio in SSB, I would like to try pre-compressing the audio somewhat to hopefully increase the average power output. My hopes in pre-compressing the audio a bit is to not use so much ALC and have a few more DB of average power without increasing spectral splatter.

I started out using a commercial voice proc but there were some design issues with the PCB and how they handled ground. I'm using the ssm2167 with pretty good success except that I'm having problems with condenser mics. Another issue is with the box I'm building, I'm incorporating the ability to switch headsets and mics between two radios and computer.

With each radio having a headset ground, logic ground and mic ground,
plus that shack ground, I've found that relays work best for keeping all
the radios happy from groundloops even though the radios sit side-by-side.

Mint condition Yaesu ft 897 hf/6m/vhf/uhf. Looks and performs like new, non-smoker, radio has been used very little, never mobile, no dents or scratches, very clean, original manual, mic, power cord, and original box. Come with fellow accessories Yaesu NiMH FNB-78 battery, PA-26B charger, CD-24 charge adapter. Just for this holiday weekend I will let it go for $750. after this weekend it will be $850, Postal money orders or paypal accepted
thanks for reading
happy Thanksgiving to all.

Never miss a thing. Make Yahoo your homepage.

20788. Age Of Radio

Yahoo group: FT897 (2007)
Date: 2007-11-20 16:55:10 UTC
From: mcharlieferret
Topic: 20788 Message: 20788

I just purchased an FT-897D used. It had been installed in a vehicle 6 months ago and the radio came right out of a sealed Yaesu box.

When I checked the serial number, I find the radio was manufactured in November of 2004. (That corresponds with the publish date in the owner's manual, as well.)

Did Yaesu make these radios in such a quantity that 2-3 year old radios are still on the shelves or did I buy a pig in a poke?

From: James Hunt KI5DQ
Topic: 20757 Message: 20790

I own two Yaesu FT-857D's, one in my Bravada SUV for 6m - 40m operation and the other in my home for exclusive VHF/UHF capability, and HF operation back-up. Primary home HF operation is with a Yaesu FT-2000.

Both transceivers were outfitted with the Inrad 1.7KHz SSB filter, which is better than the Yaesu 2.3KHz SSB filter. This concept works best during pile-ups.

Yes the FT-857 and FT-897 internally are the same transciever. The FT-857 is QRP capabile, and works fine with a small motorcycle battery. I have already done remote operation with my FT-857D, FC-40 antenna and a small motorcycle battery.

Cheers,
James

Hi Everyone:
DE WW6CC Cliff. I am new to the listserv. I just bought a FT-897D this weekend. A ham in my club who had it went SK 10 days ago. Last Fri. was our club's annual auction. Only a few hours before the auction did our club mate's widow ask that this be sold. I have no manual but downloaded one but I am having problems with the formatting when I print it. There are 2 bttys but the charger could not be found. There was a non-Yaesu PS and a non-matching LDG tuner which was sold seperately. I am trying to piece things together. So if you guys can help in fill in I'd sure appreciate it. I have to make some decisions on a PS and charger so I can get on the air.
I have been reading on line at e-ham and other places that RF gets into the optional internal PS. What has been the experiences of the fellows on this listserv?
If FT-897 owners arent using the internal PS, what are they using when shleping it around as a portable? I have an old Astron RS-20A but I know it needs 23amps. The Astron RS-30A is even bigger and heavier; hardly a portable PS.
If I have bttys in the rig and the 897D plugged into a PS, will the bttys charge up? even while operating?
I am happy to join this listserv and hope this is a pleassant and educational experience. I am excited about the new (to me) rig.
Next month my series on novice history starts in the QCWA Journal. If any of you guys or YLs were novices, please visit the Novice Historical Society and send us a story of your novice days, www.Novice.bappy.com
73s,
WW6CC, Cliff

I am thinking of a purchase. I am not sure as I have seen quite a few negative reviews for the FT897D. i.e not good on HF and that the 857 or the IC706GMK11 are much better.

Would appreciate any honest comments.

20795. Re: [FT897] MH-59A8J Microphone

Yahoo group: FT897 (2007)
Date: 2007-11-20 10:34:42 UTC
From: Robert Walling
Topic: 20660 Message: 20795

I bought a remote mic for my 857, it's nice to have those 3 programmable buttons on the mic for accessing frequently used functions while driving in the city.
I have them set up as follows:
ACC = TUNE Allows me to quickly tune my ATAS-120 while driving instead of having to hunt for it on the screen. REALLY NICE FOR HF BANDHOPPERS LIKE ME! :)
PF1 = REV Allows me to quickly check to see if a repeater user is workable on simplex.
PF2 = TAG Switches between Frequency and Callsign of the repeaters I have stored in memory.

Also, if you want to quickly fill those memories with lots of local repeaters, a good trick is to set one button for MW, one button for TONE, and another for TAG, makes it *much* easier since you now just have to dial in a frequency, TONE for pl tone, MW to write in memory, TAG to give the memory channel a name, instead of hunting for those functions by hand over and over again.

Another advantage of the MH-59A8J is that on VHF/UHF, the DTMF pad is very

handy to have for autopatch and other functions ..

I have one.

Best investment I ever made.

You punch the frequency in directly rather than

spinning the dial a bunch of times to get there.

Also have control over some of the other features.

Well worth the money.

20796. RE: [FT897] Possible purchase question from a new member

Yahoo group: FT897 (2007)
Date: 2007-11-22 03:09:44 UTC
From: Ken Bandy
Topic: 20757 Message: 20796

Hi guys, I have an FT-897D that I bought new 2 years ago, and an FT-897 non-D that I bought used a year or so ago. I had one issue with the D, in that about 2 months after I got it, the optical encoder for the VFO knob went out. I was without it for about a month while it was in for warranty repairs, but haven't had any problems since.

I bought the used 897 for portable and em-comm applications, using a Buddipole. I have had lots of fun with it in that configuration. Last month, I used it for JOTA, and right off the bat, made contacts with Germany and Italy, from central Indiana, with 100 watts.

My main word of warning is to not buy the FC-30 tuner. It will only match up to a 3:1 mis-match. That wasn't enough for my Windom on some bands. I replaced it with an LDG AT-897, and have been very pleased.

To sum it up, I've been very pleased with both of the units.

73,
Ken

Ken n all-

Glad to see you supported JOTA.
I did the same on October 20, 2007 at my sons Boy Scout campout at Lake Texoma - Texas. The scouts were amazed to be able to communicate to other scouts within the USA and Canada.

My station was operated in true field day fashion, Yaesu FT-857D transceiver, Yaesu FC-40 antenna and powered by a deep cycle marine battery. I choose the marine battery due to transmissions over a 12+ hour period, at the 100 watt level. The FC-40 antenna worked great, just passed the random wire (about 60') through the trees by first tossing a weighted fishing line as a leader.
I also have a FC-30. It will only tune an antenna that is not too far off fundamental resonant frequency.

Cheers,
James
KI5DQ

Topic: 20757 Message: 20798

Hello Chas: And group:

In my opinion yes there are better radios out there
both new and used but for the preformance to price you
just can't beat the FT857/897 rig. No it does not
have all the bells and stuff, and it is a little to
get use to with the menu, but once you get pass this
it does everything you need. 100 watts talks just so
far and yes you can do a little to increase this range
a little, recieve it does a fine job, no its not going
to be like a Pro III or the top end Yeasu or kenwoods
but that is trying to compare it to a different class
of radios. I have mine set up with the FC40 antenna
coupler and feed a ladderline feed dipole (like a G5RV
configuration), 160 thru 6 meters and works just
great, no problemo. I have a bunch of HF rigs I would
sell before lettting go of my FT897D Frank

20799. RE: [FT897] Re: ATAS 120 PROBLEM

Yahoo group: FT897 (2007)
Date: 2007-11-22 04:49:54 UTC
From: Robert Purdom
Topic: 20712 Message: 20799

After first setting the radio to all band tap the tune button quickly, do not hold it in, and the radio should recognize the antenna. If the radio showed 'wait' for about 1-2 minutes the radio and the antenna has a slight hunming sound, as the motor runs, the has recognized the antenna. Each time you change any antenna setting this should occur and if the antenna is the ATAS-120 the antenna will go to the bottom.

Next thing to check is the supply voltage. If you are trying to tune on a battery when the radio goes to transmit for tuning the voltage drops down low enough that tuning does not occur. At least I cannot tune without starting the engine in the car.

Check the grounding of the antenna to the frame of the car. If the ground is not good the antenna cannot get the SWR down. If the antenna goes all the way up and then down without tuning you may have a bad ground where the antenna mount attaches the car. If the antenna is mounted to the trunk check grounding from the trunk to the frame. Some trunk lids are isolated from the frame and require seperate grounding. Good grounding is critical with any screwdriver antenna. I own two ATAS antennas, the 100 on my motorhome and the 120a on my car. I have found that the tempermental problem is not as much with getting the antenna to operate, as the antenna will operate holding it in you hand with linemans electrically insulated gloves, but in getting a good ground and/or ground plane to get the lowest SWR.

SAFETY NOTE - Do not try tuning the antenna while holding it in you hand without linemans electrically insulated gloves. You will get an RF burn. I have 10kv linemans gloves that are certified and tested that I used when repairing my ATAS-100 antenna and immediately after the antenna started to move I turned off the radio to reduce personal RF exposure.

Also make sure that you are in one of the bands supported by the antenna. I usually use 20 meters,
14,150Mhz when testing the antenna on my car as the 20 meter band places the antenna about 1/2 way extended on my vehicle.

If you are using the antenna for 70cm or 2 meters the correct position of the antenna is usually fully retracted at the bottom. On 6 meters the antenna may not be fully retracted, but it may be so close to the bottom that it looks fully retracted.

Best of luck Robert Purdom, AD7LJ Board of Directors, Radio Club of Tacoma Washington State RACES Officer

From: Curt Givens
Topic: 20757 Message: 20800

Jean, I use my 897d with my Buddipole/Buddistick most of the time when I'm out camping. I usually have the PS and Z100 tuner along and try to work as often as other activities allow. I usually use the Buddipole for 20 and 40 meter digital and voice and when room permits I use the Buddistick with the low band coil, long whip and long (apprx 65') counterpoise to work MARS net in the 80m region.

From: "Glenn (KØBO)"
Topic: 20757 Message: 20802

I own both a IC-706Mk2G and the FT-897D

I find the FT897 is technically superior to the IC706. However, I prefer operating the IC706 over the FT897 as the operations and menus are better laid out. If I could only own one radio though, I would pick the FT-897 as there is a slight technical advantage over the 706 due to the high intermod and qrm at my qth in v/uhf. The thing is that even though I've owned the 706 for only a few months, operating it just seems very natural and non-distractive.

Things I hate about the IC706::::
There is always DC power to the finals even when the radio is off. Just kind-a scary to think about when the unit is attached to my 12v system in the house or in the car where it always is "on". Even if I were nearby when something failed and the unit started smoking, the only thing to do would be to go under the hood of the car and remove the battery cables.

The internal wiring is cludgy. I've seen several radios with broken or pinched cabling. The ribbon connectors deteriorate and the plastic becomes brittle within a few years.

The radio really needs the fan mod otherwise it runs kind-a hot even in idle.

Front panel has the mic coming out the bottom and the remote cable coming out of the side making it hard to mount anywhere other than the supplied pedestal. I don't use the remote kit because of this.

The radio does have some intermod problems in very strong RF fields such as near broadcasters.

it's not as sensitive in the v/uhf as the FT-897 as measure on the bench but the difference is marginal.

Things I hate about the FT-897::::
navigating the menu system during operations is just painful compared to the 706. Seems all new yaesu radios have this problem though. The battery buttons are a waste of real-estate on the front panel and could have been used for something better.

Out-a the box, it seems all the 897s have these same problems... bias settings are wrong and DSP noise in the audio. Each radio has to go back to yaesu to be mod-ed and re-aliened to work correctly.

You would not go wrong purchasing either of these two radios.

From: David Piersall
Topic: 20793 Message: 20805

I bought the internal power supply along with the radio. It makes a very compact package and the power supply doesn't add a lot of weight. I've tried switching between the internal power supply and an external Astron. If there's a difference in noise levels, I sure couldn't hear it.

For running picnic table portable, I use a large AGM battery. It's heavy, but it'll run at full power for hours and hours.

Dave, what size AGM do you use. I'm considering the West Mountain power device that keeps the battery charges off the ps and switches to batt in a power outage.

It would be interesting to know how many radios a manufacturer must make to be economical. Yaesu really jumped out of the box with the 857 and the 897, because they are basically the same radio in a different box. Production cost of the populated circuit boards are being shared by two different model radios.

Another thought, is how Yaesu determines serial number production dates. Is it based on date of radio final assembly or date of production of the main circuit board?

Ham radio manufacturers have to design, make, and ship different radio formats to various countries with different band plans. My bet, they make enough NA models that it takes 3 to 5 years for them to be absorbed (purchased) by Hams in North America.

There is a file in this group's files section, Yaesu Production Information In Serial Numbers.txt
that tells how to decypher the Yaesu FT-897's serial number.

As I said in an earlier post I ordered a pr-used 2006 897D. well I was persuaded not to get a 897 but a IC706G MK 11. Mistake. I think it was very noisey on RX and very hissy.both on HF and V/UHF. Even the local repeaters here which are 5/9 were hissy. So the deler is taking it back and is exchanging with a slight refund to a new 897D.

I hope this time all will be ok!

For better audio, remove back cover, then carefully remove mic element from the front half.

Under it, you will find a solid plastic piece between the front opening for sound to enter the mic and the mic element.

It is easy to remove, as it is not glued into place.

Once removed, you can then choose to enlarge the one opening for audio to enter the mic, and drill the other 2 openings with a very small bit to allow more audio into the mic element.

This mic is made to be "eaten". Turn it 90 degrees to you mouth, and place you thumb (that controls the ptt button) on your chin, just below your mouth (for left-handed grip). This is not the mic to place 2 feet away from your mouth and speak into it in a normal voice.

You will be amazed the before and after audio reports you will get after this simple modification. It allows audio to directly enter the mic element, not be diffused by a plastic sounding board that serves more to prevent audio from entering than to protect the 99 cent mic element.

20815. FT897 and Ham Radio Deluxe Question

Yahoo group: FT897 (2007)
Date: 2007-11-26 04:07:06 UTC
From: roj_blake42
Topic: 20815 Message: 20815

Hi All,

I am using FT897D with ham radio deluxe (HRD) rig control software run over the internet. A nice combination that works well for remote base operation.

Does anyone know whether it is possible to change FT897D menu setting #80 (SQL/RF Gain) via a CAT command from HRD?

When I operate the radio remotely, I want to be able to change the dial from RF gain to SQL as I switch from HF SSB to VHF FM, but HRD does not give the option to create a button with this function.

I know that there is an "auto squelch" function whereby in FM the squelch is enabled even if menu #80 is left in RF Gain. But I am not sure about the "strength" / "sensitivity" of the auto squelch and would prefer to be able to set it myself.

Does anyone know if it is possible to change menu setting 80 via HRD?

There certainly isn't a documented command to do this. Whether it is possible using un-documented ones is anybody's guess, but I don't see what it would achieve even if you could change it. As far as I am aware it is not possible for HRD to remotely control the Squelch/RF Gain knob setting anyway.

I downloaded HRD at the weekend to try out. My first ever attempt to control a radio by software. I had a similar query to yours - in my case, whether the HF power output can be varied through the software control. I have yet to locate the method of doing that, assuming it is possible.

I would guess, and it is only a guess, that if a CAT command exists for it, it should be possible to change the SQL/RF Gain via the HRD. However some reprogramming may be necessary. I took a look at the "Info:CAT Support" under the Options tab, and found quite a few commands but not that particular one. I don't know if it is possible to user-modify the source file, which seems to be just a txt file. If you can find the relevant CAT command, it may be possible. Perhaps the HRD forum can provide a definite answer.

20819. no anymore anwer from CAT CT-62.

Yahoo group: FT897 (2007)
Date: 2007-11-26 22:38:30 UTC
From: f5alj
Topic: 20819 Message: 20819

Hi everybody,

I have the following problem: my FT897D/LDG-AT897 worked perfectly
until today (including RS/232 CAT communication).

During CQ Calls, it shut down then up alone, (after ALC at maximum,
SWR 1/1 and power to 75watts). Three to five times. It resets to
factory setting alone twice (!).

Then, it seems to work correctly except the cat.
I mean : no anwser from tx with same parameters on PC side and TX side

menu 19:4800bps
menu 20:CAT

I have tried on windows through logger32, Hamradio Deluxe and trough
linux Hamlib, rigctl, grig, xdx and jLog. Through LDG-AT CAT OUT port
and directly from TX CAT port.

It seems to be out for rs232 communications.

Does someone have any idea before calling Yeasu aftersales ???

Thanks for reading,
Jean - F5ALJ

20820. High SWR

Yahoo group: FT897 (2007)
Date: 2007-11-26 23:10:24 UTC
From: J. R. Reich
Topic: 20820 Message: 20820

I am new to ham radio so don't flame me if my question is stupid...

I have a 897D with a LDG AT-897 tuner, and I just erected a MFJ-1798 on top of a 30 ft. tower. The SWR on 20 meters (14.070 MHz) is 1.5, measured with a MFJ-259B analyzer. However, when I attempt to transmit, the SWR indicated by the radio is off the scale and the HSWR indicator is present.

I have tried to use the "full tune" mode of the LDG tuner, but that doesn't seem to make much difference.

I am at a loss to explain why the analyzer sees a SWR of 1.5, but the radio sees something much, much higher.

Any suggestions would be greatly appreciated.

Jay

Hi Jay...

2 possibilities come to mind.

Do you have your analyzer hooked up to the HF connector on the back of the radio? If hooked to the VHF/UHF side, the radio would give you the HSWR report but the analyzer would show good to the antenna.

The other possibility is that the jumper cable between the radio and the analyzer is defective. Have you checked it with an ohm meter?

Jay,

Where did you connect the MFJ analyzer? Directly to the coax that connects to the LDG tuner?

Maybe you can describe how many coax connections that you have between the LDG and the antenna.

Subject: [FT897] High SWR

I am new to ham radio so don't flame me if my question is stupid...

I have a 897D with a LDG AT-897 tuner, and I just erected a MFJ-1798 on top of a 30 ft. tower. The SWR on 20 meters (14.070 MHz) is 1.5, measured with a MFJ-259B analyzer. However, when I attempt to transmit, the SWR indicated by the radio is off the scale and the HSWR indicator is present.

I have tried to use the "full tune" mode of the LDG tuner, but that doesn't seem to make much difference.

I am at a loss to explain why the analyzer sees a SWR of 1.5, but the radio sees something much, much higher.

Any suggestions would be greatly appreciated.

Dan,

The analyzer was connected to the antenna feed line (which I removed from the tuner for testing). The feed line is LMR-400 and the only connections between the tuner and the antenna is the lightning arrestor at the base of the tower.

Thanks,

Jay

Joe,

The analyzer was connected to the antenna feed line that I removed
from the tuner (for testing). The tuner is connected to the HF
connector on the radio. The jumper from the radio to the tuner is
okay since I just recently used the rig with a long wire antenna.

Thanks,

Jay

Where is the SWR meter located? Is it the SWR meter in the radio or a separate SWR meter?

Jay,

OK, so the LDG Meter is reading the SWR between the radio and the tuner input. It is not reading the SWR between the tuner and the antenna.

You need an SWR meter between the tuner and antenna to know if the tuner has done it's job.

Is the output power of the radio at full output according to the radio power meter? Or has it folded back due to the SWR being high?

Dan,

Okay, that got me to thinking... I tuned for 20 meters then I removed the jumper cable between the radio and the tuner at the radio end and hooked up the analyzer. Now the analyzer reads >25 !!!

Next I connected the antenna feed line directly to the radio HF connector and tried to transmit - SWR of 1.1 without the tuner!

Do you think the tuner is kaput?

Thanks,

Jay

Jay,

In theory, the Tuner should be OK. Putting the analyzer on the input to the tuner provides no valuable information. The analyzer is looking at a complex impedance at the tuner input.

If the radio works fine without the tuner, then why bother using the tuner?

Hmm ... so the first time, you had:

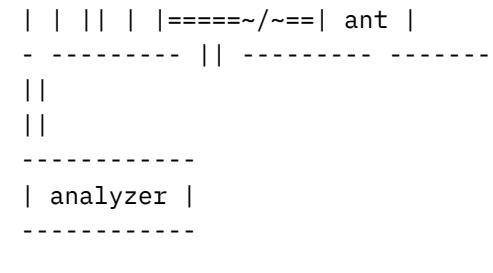
```
- --------- --------- =|=
| | | | |
| radio |====| tuner | |
| | | | -------
| | | |= ====~/~==| ant |
- --------- --------- || -------
||
||
------------
| analyzer |
------------
```

and got a useable SWR, and when you did this:

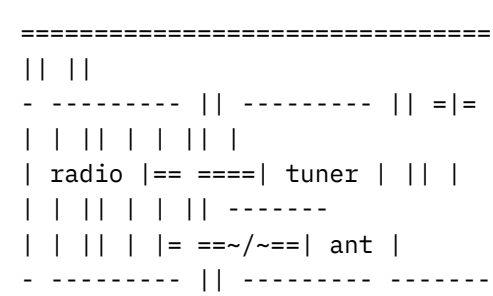
```
- --------- --------- =|=
| | | | |
| radio |====| tuner | |
| | | | -------
| | | |========~/~==| ant |
- --------- --------- -------
```

and got a high SWR, and when you did this:

```
- --------- --------- =|=
| | | | |
| radio |= =====| tuner | |
| | || | | -------
```

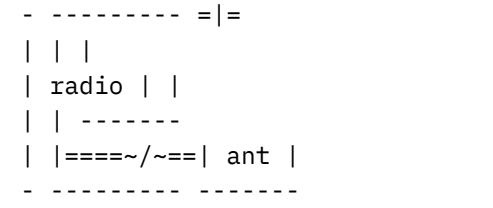


you measured a high SWR, and when you did this:

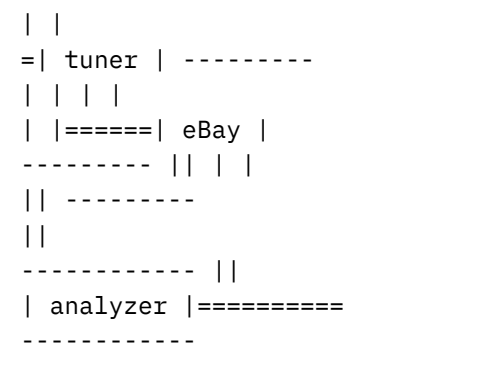


you again observed a useable SWR?

If so, then I suggest this simple solution:



Which will then let you do this:



Cheers! -d

Dan,

This statement:

> You need an SWR meter between the tuner and antenna to know if the
> tuner has done it's job.

is incorrect. An SWR meter between the tuner and the antenna will tell you nothing. It does not matter what the tuner does (tuned or not), the SWR will always be the same on the antenna side of the tuner.

I try not to be the negative one. This group does a great job of providing input to many issues (897 radio and other). Occasionally, the miscues in the theory need to be addressed.

Sorry, this is slightly off-topic, but this group seems well-informed about many things, so perhaps someone can advise me..

I'm trying to decide which HF antenna to erect on my rented two-storey townhouse in Melbourne.
Whatever I choose, I'll probably have to jump through some hoops to get each one individually approved - and thus I probably can't easily just erect several and compare them all.
So I wondered if you've had prior experience of what will work best.

Townhouse has a flat metal roof, and small balcony on either side. No garden or courtyard.

Choice 1) Erect a vertical antenna on roof. Probably can't be excessively high, say 10'?

Choice 2) Suspend an off-centre-fed dipole a couple of metres above the metal roof. (ie. put plastic or wooden poles at opposite corners of roof). I can probably get about 16m long on that diaganol.

Choice 3) Loop antenna, again, suspended just above the roof - say 32m total.

Choice 4) Loop antenna hung off side of house - would be shorter in wire length, but at a perpendicular angle, facing horizon.

Choice 5) Random wire antenna, running from ground up vertically two storeys of house to near the roof. Balun used and grounded into the earth reasonably well. Say 12m or so?

Currently I'm thinking (5) because it's simple to erect, and sufficiently unobvious that I can probably get away without getting permission. However it would be low, and not very long. :/
Second thought would be the OCFD above the roof. I guess if I drooped the sides down the side of the house I could lengthen it quite a bit..

I’ve had great success with the Cushcraft R-5 before, in very tight places. Now they make the R-8 that goes 6-40. The R-5 had it’s own impedance matching system, and combined with tuners on both the Yaesu 1000D and FL-7000 AMP, I was able to tune the R-5 for 80. Anyhow, I think that’s how it went. If it wasn’t 40 to 80, it was 20 to 40, but I’m fairly confidant the R-5 did 40. The whole thing is if the R-8 is anything like the R-5 it’s great because it saves space and you don’t necessarily need radials. Thank you.

Best regards,

Jeff- KD6NBD

I would go with choice #1. And/or choice #5. The flat metal roof is
going to cause you problems with all the horizontal antennas you
suggested. But, it may actually help with the vertical. My choice in
this situation would be the vertical, as tall as possible, located as
near to the center of the roof as possible. Bond the ground side to the
metal roof as well as you can.

Good luck!

Dwayne

As I posted earlier, I stand corrected. It was late for me and I was dyslectic in my thinking when I posted that comment.

Dan,

This statement:

> You need an SWR meter between the tuner and antenna to know if the
> tuner has done it's job.

is incorrect. An SWR meter between the tuner and the antenna will tell you nothing. It does not matter what the tuner does (tuned or not), the SWR will always be the same on the antenna side of the tuner.

I try not to be the negative one. This group does a great job of providing input to many issues (897 radio and other). Occasionally, the miscues in the theory need to be addressed.

Dan:
The objective of the tuner is to correct for a "complex impedance", so looking into the tuner from the radio side is certainly valid. Or did you mean the antenna side of the tuner when you said "input to the tuner"?
In this situation (if I have my information correct) the person believes his radio is seeing a high SWR while the analyzer connected to the antenna transmission line is showing 1.5:1. He also believes that the jumper between the tuner and the radio is good. Assuming all of that, it makes sense to see what the SWR is looking into the radio side of the tuner. If there is a problem with the tuner, or if the tuner is sitting at a solution for another frequency, then he may very well see a high SWR there. At that point, he should put the tuner in bypass mode to check it that way, then tune to the current frequency and see what it says then. One way or another, he has to determine if the tuner is working or faulty. Having an analyzer between the tuner and the radio will confirm the SWR the radio is seeing and will help to diagnose any potential problems with the tuner. If the tuner is working correctly, and has found a good solution for the current frequency, the analyzer should show a low SWR with minimal reactance at the target impedance.
Also, the type of antenna this person has is likely to be fairly narrow on some bands. Even though it may be only 1.5:1 on some parts of the band, it's likely that having the tuner in-line will be helpful when he gets closer to the band edges.

Turn on the "sliders" in the view in HRD (or the icon bar if you have that on the top of the screen. Somewhere in your central window (usually near the bottom) you will have a bunch of sliders controling various functions including the various RF power levels. You can customise these as well as the other on/off buttons for features by going to the preference options to select which buttons/sliders you see.

Topic: 20820 Message: 20842

Chuck,

Thanks for the excellent info.

As a further test, I used the "full tune" function of the tuner to tune to 14.070 MHZ and experienced the same high SWR that I discussed previously. Just to see what the tuner was doing, I put the analyzer on the radio side of the tuner and found that the resonance was at about 60 MHZ. Then I put the tuner into bypass mode and found that the SWR was back to +/- 1.3.

Clearly there is a problem with the tuner and I will take the issue to LDG for resolution.

Thanks,

hi all
this may be a late post for this problem but i had some similar probs when i first used my at 897 tuner with my ft 897d and i had the radio /tuner cable backwards. the cable is clearly marked and i still hooked it up backwards and thought the tuner was workin when it wasnt.
i know that was a dumb mistake and not a very techincal diagnois but sometimes it could be sometin that simple.

You are measuring the SWR on the line from the antenna, not on the line from the tuner to the radio, right?

You ARE connecting to the radio's HF outout, right?

Bqasically, you need a short jumper from the LDG to the radio's HF antenna connection and the antenna should connect to the tuner's antenna connection. Check the tuner's manual and make sure everything is connected properly, or eliminate the tuner altogether and try transmitting directly with the antenna connected to the radio's HF antenna connector, If you're looking at the radio from the rear that's the left-hand (inboard) SO239 coax connector.

Uh, Joe, the 259B analyzer has its own RF source and should be connected to the antenna only, never to the radio.

But you have a point. Is the antenna in question connected to the right port on the radio (HF for 1.8-54mhz, VHF for 2m and 70cm)? If the antenna is connected to the wrong port, the SWR will be off the chart.

Either that or you're not giving it enough to tune with. What I do is set up AM for about 25 watts and turn the mic gain to zero for that mode. Flipping the rig to AM and keying the mic causes the radio to emit a tad over 6 wattsof carrier. This is plenty for my MFJ auto-tuner to bite on and should be enough for the LDG. It makes like a rattlesnake for a bit unless it knows the frequency/antenna combination, but it usually manages a match. With that antenna you probably won't need the tuner and can safely by-pass it except on 80m (because the antenna is quite sharp there and the tuner can extend your band coverage).

You may want to think about, for multinband use and you can use the Roof for the ground plane, a Mobile Screw Driver antenna mounted securly to the metal sheeting.
No matter what antenna you end up with there is going to be a compromise and a HI-Siera or other screwdriver Antenna may be the ticket and most Screwdriver antennas cover 80 thru 6 meters.

From: Bret Mills
Topic: 20850 Message: 20850

Hello to the group
I have a weard problem that West Mountain Radio or myself has no clue on what is happening.
I have a RIGblaster plug & play unit here that the CAT control does not work on "RT Systems" programing software, "Ham Radio Deluxe" or "Super Controller" software but I can control the frequency via CAT using "MIXW" software which is about all the CAT function that MIXW can do so that tells me the interface is working somewhat.
I have moved it around on differant COM ports and BAUD rates along with the Radio.
I have used ALL the above software using the Yaesu CT-62 interface on a regular and / or USB serial port and they all works very well.

From: Rob
Topic: 20851 Message: 20851

Hello to the group,

I am a new member on this mail server. I've been lurking
for a while...

I have noticed that when I try to tune on 60meters, using
the memory presets, the AT897 locks the TX on. Pressing
the tune button again turns the TX off again.

This is in USB mode and low power (5W).

Has anyone else seen this?

Because you DO NOT need a PC/radio interface, could be why you are having problems. Just hook your compter DIRECTLY to your radio - NO INTERFACE NEEDED. You will find it work the best this way!

Dennis - N8BMB

There is a smt type fuse that might of opened. there is a place in the files on this group. i had to replace the one in my ft-857d i think the ldg tuner requires a bit more than the 3 amp to startup. i placed a 5 amp and everything has been working great since the fix over a year ago. I notice a lot of pepole talk these radios down. but like any other radios problems develop. just the nature of electronics.

20855. For Sale: Heil Handi-Mic Pro for the FT-897

Yahoo group: FT897 (2007)
Date: 2007-11-29 20:47:37 UTC
From: David Inger
Topic: 20855 Message: 20855

If you want to improve your audio, this is the mic for you. This is the PRO version with the Heil wide range element. The mic is unused (but tested) and is in as-new condition. It comes with a CC-1YM cable that mates to Yaesu modular mic jacks used by the FT-817/857/897 radios and possibly others. Includes the mic, cable, mic clip, wall/dash mount, foam windscreen and box. You can even use this as a desk mic with the proper stand. $80 plus shipping.

20856. INTERNAL AND EXTERNAL AUDIO GONE

Yahoo group: FT897 (2007)
Date: 2007-11-30 00:13:15 UTC
From: ljb59mhs
Topic: 20856 Message: 20856

AFTER 5 YEARS OF WORKING HARD THE INTERNAL SPEAKER AND EXTERNAL SPEAKER CONNECTION NO LONGER WORK. FRONT PHONES STILL WORKS BUT THAT IS THE ONLY WAY TO GET AUDIO. I HAVE CLEANED ALL AND CHECKED ALL THE CONNECTIONS, HOOKED UP OTHER SPEAKERS, AND RESET TO THE FACTORY DEFAULTS. IF ANYONE HAS FURTHER SUGGESTIONS OR CLUES I WOULD BE APPRECIATIVE. THANKS. LARRY KD5MXK

20857. Re: [FT897] Re: no anymore anwer from CAT CT-62.

Topic: 20819 Message: 20857

Thanks for all your suggestions.

In fact, there was an effective HF return because of one SO-239 from my LDG AT897 (bought as new 1 month ago) that was'nt correctly fixed.

The result is 2 cms resistors 22Kohms has to be replaced, the CT-62 is hs and had to be replaced for a total of 247 Euro ($348).

So, please if you here my call, please give me a break, I would like to make a lot of contact with this TX

Just a quick question, you do have the accessory cable that RIGblaster sells seperatly for CAT control, and it is the correct one for the FT-817? This was not mentioned in your post.

20860. Re: INTERNAL AND EXTERNAL AUDIO GONE

Yahoo group: FT897 (2007)
Date: 2007-11-30 17:47:42 UTC
From: Rob, WB1AEX
Topic: 20856 Message: 20860

Hi Larry,

I would be very suspicious of the audio out connector on the back of the rig. It is possible that one of the connections to the mainboard is broken, or that the tab inside the jack has fatigued or broken off. The only way to check is to lift the cover and inspect. The fact that the front panel jack is still functional is a pretty good indicator that something is funny with that rear panel jack as the audio to the external and internal speaker are routed through it.

73,

Rob WB1AEX

20861. File - FT897 Group Guidelines.txt

Yahoo group: FT897 (2007)
Date: 2007-12-01 10:58:37 UTC
From: FT897@yahoogroups.com
Topic: 5240 Message: 20861

The FT897 Group averages around 320 (+/-100 one-sigma) messages per month. Because the volume of messages is rather large, I would like to remind everyone of a few long-standing FT897 guidelines to follow. Most of you do so already.

1. Civility. (This is practiced well by our members!)

2. Please sign your messages with name and call sign, e.g., Fred - W1XYZ.

3. When replying to a posting (message), kindly delete all unnecessary text including the trailing text. Only leave the text from the prior message to which you are replying ... <snip> the rest. If one desires to read the entire thread, the command [Up Thread] at the top of the message can be used to read the entire discussion. Remember also that a lot of members have slow connections and some even pay connect time or characters rx/tx. This also helps the clarity of your message.

4. When replying to a post, please decide if your comment should be to the entire group of over 4,300 or directly to the author of the post. When you click on "Reply," it goes to everyone. To reply direct (simplex), you should click on the email address following the user ID line at the top of the post. Notice that only a part is shown for privacy. Also, please think about if what you are about to post in reply to the group really should be to the group ... replies like "I sure do agree with that" doesn't add much to the group. Send thoughts like those direct to the poster please.

5. It is fine for members to post something for sale or wanted to buy ... once per item(s). All questions and offers to buy/sell should be made directly to the poster, not to the Group. The member posting the FS or WTB may post that the item(s) was/were sold/purchased.

6. Posting of commercial items for sale by manufacturers or dealers is also fine, but should be done on an infrequent basis. The FT897 members benefit by learning of hardware, software, sales, etc. before it appears in magazines, etc.

7. New members are all moderated until their first posting. If it follows the guidelines, it is approved and the member is change to unmoderated status. This list is a partially moderated list, i.e., only first message is moderated while later messages are monitored after posting. If an unmoderated posting is found by the moderators to have a problem, then the poster is contacted directly to resolve. Actions are taken against those that chronically violate the rules.

The reason for this form of moderation is to block spammers from the list and it has been working.

8. Do not add disclaimers to your posts that (1) restrict the ability of other members to use the information you post, (2) claim a copyright to your post, or (3) to claim any type of "rights" as a consequence of another member replying to you post either directly to you or to the group.

Thanks to all es 73,
Barry - W4WB

20862. CT-39A Cable and Sound Card modes

Yahoo group: FT897 (2007)
Date: 2007-12-01 14:07:52 UTC
From: Curt Givens
Topic: 20862 Message: 20862

The manual seems to assume you're going to use a TNC to do PSK etc. I want to use the cable to go to my sound card and use CAT to PTT. I'm using MixW 2.18 and up until now have used a RigBlaster plus. I've got two questions. Do I use stereo or mono plugs?(I suspect either will work with the audio to the tip and signal ground to the shaft. No ring connection if I use stereo plugs) and does it matter which connection 1200 or 9600 when you do sound card modes?

Tnx, Curt

20863. No RF on HF phone

Yahoo group: FT897 (2007)
Date: 2007-12-01 18:02:53 UTC
From: Bill Barron
Topic: 20863 Message: 20863

Unusual problem has developed. Almost no phone RF on any
HF band; but no issue when running digital from rear
jack.

Mic gain cranked way up -- but has little effect.
Three different mics tried; same result.
897 Menu's seem to be set correctly.

No issue on VHF RF power; but have same mic-gain
issue. Modulation /ALC/RF being measured on 3
different meters. Modulation looks ok; ALC
in limits; no RF.

I have blown the finals out of this rig before;
but haven't run more than 15 watts in over a year.

Suggestions?

Bill W1WAB

I just recently built a CAT and DATA box - yes, stereo plugs are used.

Only the tip and 'ground' are used - for the mic, at least, the ring *might* have a 5v bias power on it:

http://www.epanorama.net/circuits/microphone_powering.html#soundcard

I brought both 1200 and 9600 to the box and tied to the 1200 position on the data port, although I left behind a jumper so I could change it if I needed. I use Ham Radio Deluxe and DM780 - works great.

Hello to all

I have just bought a Ameritron ALS 600 and in the instruction manual it goes on to explain the connections via a RCA relay connetion and a RCA als connection.
Of course on the 897 we have a din plug connection for a linear and i wonderd if any one could give me advice on the correct procedure for connection ie correct schematic diagram for Din to RCA and what type of audio cable to use any advice would be appreciated as the 897 manual is not a great help

Richard,

It's a 3.5mm TRS (stereo) plug you need. The hole in the main casting
just clears the standard size plug.

20870. MFJ-984, 3 KW antenna tuner for trade

Yahoo group: FT897 (2007)
Date: 2007-12-02 18:15:55 UTC
From: Dan Evans
Topic: 20870 Message: 20870

Group,

I have an MFJ-984, 3 KW antenna tuner I would like to trade.

This tuner looks good, and comes with a copy of the manual. The previous owner told me the front panel meters work erratically. When I have used it, they didn't seem to work at all, however I have always used low power. The meters may be an easy fix, but I don't use them anyway so I never pursued it. Operationally, the tuner works great.

Anyway, the 984 is an older model that is no longer in production. From what I can find, it is very similar to the Dentron MT3000a. Basically it is a very heavy duty, high power manual tuner. It has an 18 position tapped inductor, and a dummy load. The antenna selector switch switches between 3 coax inputs, 1 single wire input, or 1 balanced line input. It also has an SWR/Power meter, and an RF amp meter. The meters didn't work in my test, but I was only using a 5 watt rig so it may not have been enough power for it. I can also send pics, inside and out, if you desire. I have a broad band connection, so can send as many pics as you like.

I don't own an amp for HF. This is the main reason I'm looking to trade this tuner. I don't plan on running high power anytime soon, and I do a lot of portable stuff so a smaller tuner would better suit my needs. I don't usually take my rigs back-packing. I normally drive up to a location, set up the rigs and operate. But this is a BIG tuner, not something I would want to Rover with:-) What I would like to have is a small, auto tuner for portable use. Must be rated for at least 100 watts, and in perfect working condition. I'm not overly concerned with the cosmetics, as long as I can depend on it in the field... Looking over the current models, I like the LDG AT-100Pro, Z-11Pro, or maybe the AT-897. I would prefer one of these, basically in that order, but would consider others. What do you have to offer?

Update: I have had several inquiries, but nothing solid. Upon using a full 100 watts [all I have to offer...], the RF amp meter seems to work fine. But still no response from the Watt/SWR meter.

Hi Richard

It is a stereo 3.5mm socket

If you are using a bug key with the internal keyer, the tip is "di" the middle section is "dah", the shield is common

If using a pump key (or an external keyer), tip is the Key and the shield is ground (centre section not used - or use a mono plug)

In the manual, there is a wiring diagram for the connector, page 11, I think. Also, obviously, only one connector will fit, so if you try the wrong size it won't damage anything, unless a hammer is used <grin>.

20875. RE: [FT897] Rear panel socket for key

Yahoo group: FT897 (2007)
Date: 2007-12-02 22:10:51 UTC
From: Mark Vaughan
Topic: 20867 Message: 20875

One thing you've forgotten, at least if the 897 has the same problem as the 857, a problem that seems common to yaesu.

The jack sockets on the back of these radios are behind the alloy chassis, with a small hole in the chassis so most standard stereo jacks don't go in quite far enough. You have to chaff the body of the plug down a bit so it will reach the internal terminals. You could also open the chassis up.

Another thing, if the plug comes loose so it isn't quite in all the way the radio doesn't power up properly, can't remember the exact symptoms, it may power up in Tx or something odd. Just keep it in the back of your mind, if you think you've screwed up the radio, check the key jack.

In the manual, there is a wiring diagram for the connector, page 11, I think. Also, obviously, only one connector will fit, so if you try the wrong size it won't damage anything, unless a hammer is used <grin>.

Subject: Re: [FT897] Rear panel socket for key

Hi Richard

It is a stereo 3.5mm socket

If you are using a bug key with the internal keyer, the tip is "di" the
middle section is "dah", the shield is common

If using a pump key (or an external keyer), tip is the Key and the shield is
ground (centre section not used - or use a mono plug)

Regards
Rob, G4LMW

Subject: [FT897] Rear panel socket for key

Hello,
Just got my FT897D. Looking at the rear panel socket for connecting a
key and can't quite decide what type it is. Manual doesn't help.
Don't want to try unknowns in case I damage the socket. Could it be a
2.5mm jack ?
Thanks,
Richard, G4CZP

20876. Swamped by local BC station ... 1.8 and 3.8 Mhz

Yahoo group: FT897 (2007)
Date: 2007-12-03 00:31:50 UTC
From: Graham
Topic: 20876 Message: 20876

After some improvements to the vertical for use on top band , it looks like I have also incresed the signal from the local BC mw station on 1485 ....even with the attenuator in , its causing , blocking and cross mod ...

If i fit a 'BC' filter in ae signal path , high pass , cuts off round 1.7 Mhz all is fine ....can even have the pre-amp 'on' with no problems , but cannot transmitt ..

Is there any way of getting to the 'RX' signal path , to add the filter ????

Tnx

Graham ..

Install the filter with a RELAY (remotely activated, electromechanical switch) to bypass it during transmit.
A four pole, double-throw relay, wired to the PTT/TX ground circuit will work. If you do not understand, get a buddy with more experience to assist.--73, KC3VO, Bob.

Hi Graham - I'm not quite answering your question, but I've solved my problem by use of the SPC tuner design (ARRL handbook from some time ago) and it gives a nice bandpass response at resonance. I've used one down on 160 and it does eliminate the BC interference. The "T" and "L" networks don't do very well in this regard.

Best of luck, Bob has the right answer, of course (he usually does!)

Sam,

Throw the FC-30 in the garbage and buy an AT-897 tuner. It has a pass-through for the CAT and a fan that does not run constantly. Plus, the SWR tuning ratio is 10:1 vs. 3:1 with the FC-30.

(I'm only joking about the garbage statement. Put it on eBay and it will pull around $160 depending on the condition. It will pay for your AT-897 which costs $149 brand new)

Ok ,

Well, I have a couple of 12v coax realys that I could make a
changeover switch with, (I was going to m use them for vhf , till
some one posed here that you could set the vhf power ssb to 1 watt)
I was hopeing there might of been a way of getting to the 'rx'
signal path in the set.

The bc filter is the one from the arrl book, 'high pass' ie rejects
all below about 1.7 mhz , or at least the one I made dose !, but its
too small to transmitt into

.... any 'bigger' versions about ?

Tuner, Im running a racal 1kw auto tuner, relay configured , out in
the garden shead , which , looking at the cct , its a 'L' match ,
dose a good job of matching ... but

At first I thought, I had a bad joint causing rectification, but
fitting the filter solves the problem , looks like the level to just
too much ...

tnx

Richard,

If you look through this forum you will find a number of instances of people having key jacks going faulty on them and which may well have been caused by RF getting into the rig via the key connection.

Apparently the filter components in the rig are possibly somewhat under-rated.

With this in mind G4NLA has designed and built a filtered key filter and lead assembly and for my sins I've been putting it through its paces over the last couple of days.

Whilst I haven't done a "destructive" test I've deliberately operated my '897 in a pretty hostile environment (aerial feedpoint less than a foot from the rig and associated wiring - admittedly poor RF practice, but I wanted to prove a point!) and have had no ill effects at up to 100W output on a number of bands.

Details are on Gee's web site at http://www.wirelessshack.biz/Filter_Paddle%20RFI%20Filter.htm if you want to know more, or follow the link from my own web site. There is enough information there for anyone to brew their own if they wish.

Clearly when building compact equipment some compromises are made in design and rating of components, and this could well be one of them.

Hope this is of some interest,

73

Graham:
This is a problem with the FT-897 that some, as well as me, have identified as a problem before the preamp. It's probably due to bias problems with the switching diodes so that strong signals drive them into or out of a conducting state. This means that any fix associated with the radio would have to either fix the problem or avoid it. Putting the filter in the receive path is going to be putting it past the problem and will therefore do no good--which is why switching the preamp in or out makes no difference.
In my case, since I use my 897 mostly for portable/temporary use, I'm generally not experiencing the problem, but I did see it and determine where the problem is when I had it connect to some antennas at home. I'm about 1-2 miles from 3 AM broadcast stations.
As suggested, you could put in coax relays to bypass the filter when transmitting, which is perhaps the best solution. The other option is to rebuild the high-pass filter to be more robust so you could transmit through it. That might mean not being able to use it on 160 Meters.

One more note on a simple solution, I know that probably many of you already know, but just for the newer guys I'll repeat (it sure helped me a whole lot in many, many situations!) Put a nice bandpass-response antenna tuner there near the transceiver and lose the BC coming up the line. The SPC design from the handbook and the traditional Z match will do it. With some nice attenuation at BC frequencies and the added benefit of the tuner itself for adding available bandwidth for the transceiver, it is a nice addition to the shack. It is also a good thing to have for Field Day operation, or whenever you might have strong signals in close proximity to your antenna, the narrow bandpass response helps your receiver cope with strong signals above or below your operating frequency. (And, of course, attenuates any crap your transmitter may be emitting well outside your operating frequency.)

Yes, that is normal with the G5RV that ant. operates right on the max edge of the Yeasu tuner. The MFJ model has a 10:1 range where the Yeasu only has a 3:1 swr range. Hope that helps.

Let me see if I understand you correctly. If you are
having trouble with high SWR at the radio, but normal
SWR at the tuner, and you have tried this with two
different tuners, then I would suspect the coax jumper
that you are using between the radio and tuner(s)is bad.
Try swapping that coax out with a known-good cable.

From: kc3vo@aol.com
Topic: 20876 Message: 20897

There are relays with many sets of contacts available, simply use the CAT/LINEAR connection to operate the relay, and wire one set of contacts to the computer, and use the other contacts to switch the filter, linear, pre-amp, etc. --You could even connect 2 or 3 relays in parrallel, provided that they require the same voltage, and total current is not excessive. Only basic electrical skills are needed, but if unsure, find a more experienced local ham to assist. 73, KC3VO.

Somewhat off topic, but some 30+ years ago, I had a fault on a low power Band V TV transmitter. The tuning of the output stages is rather critical to obtain a flat frequency response over a 10MHz or so bandwidth.

At the time I had aligned several of these units at various frequencies with little difficulty but one gave problems. It gave the specified 50W+ output but it was impossible to get the bandwidth correct, there was a large notch right in the middle. I could move the notch, but not get rid of it out the passband.

After some time spent diligently searching around the power amplifier, I eventually found the fault. The output from the amplifier cavity was connected to the rear panel connector by a 6" length of 0.181" semi-rigid co-ax. I measured the cable and it was a 0.1 ohm short.

When I dismantled the N-type connector on one end, I found a tiny piece of copper, a bit of swarf from the solid copper jacket, which was shorting the connector. The amazing part of the story is that the co-ax line could be so tuned that the short circuit would still transmit the full power.

Heil, as well as others probably, makes a "break out" cable that plugs in to the modular mic input on the front panel, and gives you the actual mic input and PTT line. I use one with a trigger switch, but you can use it with a foot switch too.

73,
Ken

I use a Heil headset and the PTT line is via the mic socket to either a foot switch or a hand ptt. If you get a heil to mod connector adapator you could try that.

Hmm, The Marconi Company I worked for was the Radar Company.

The TV transmitters were made by a German competitor of Marconi.
Having seen the Marconi TV transmitters, I am glad that I worked
for the competition!!!!

20905. CAT get/set frequency (no answer).

Yahoo group: FT897 (2007)
Date: 2007-12-08 09:34:34 UTC
From: Jean RIVIERE
Topic: 20905 Message: 20905

Hi all,

Sorry about asking for my own problem, but perhaps it could help someone else.

My 897D with AT897 (LDG) worked good with CAT interface in relation with my PC and then, after different HF returns, impossible to set or to read frequency. ie: monitoring the rig with software did not work anymore. Tune from AT897 works normally with CAT/connection.

I sent it for reparation to my Local National Vendor, who has replaced 3x22Khom resistors and asked for 3h of research time, and said that my original CT-62 is dead.

I took my 897D (and the big invoice), and decide to buy a compatible CT-62.

What a surprise, when I received my compatible cable : impossible to set/get frequency !!! (AT897 connected or not).

HamRadio Deluxe connects correctly the com port, all checked are green except : read frequency

Does someone has any ideas ?

Thanks for reading,
Best 73 to all and good Chrismas preparation.

20906. ALC Mistery

Yahoo group: FT897 (2007)
Date: 2007-12-08 10:10:27 UTC
From: Jean RIVIERE
Topic: 20906 Message: 20906

Hello to all,

Sorry about this question but there is something that I do not understand with my 897D, particularly ALC mistery.

In SSB mode, AT897 provides a 1:1,1 SWR, ALC acts before anything and when I transmit ALC is ALWAYS from 8 to max bargraph segments (!) and modulation/power are only 0 to 6 bargraph segments (same on a dummy load).

In my comprehension (but I'm certainly wrong), in SSB mode, modulation is make inputs and starts the chain for compression, amplification power and emission. ALC (in my comprehension) is made for reducing to much input of modulation or for a better spectral utilisation and transistor protection for HF return. So ALC have to be lower than modulation (is'nt it ?).

But, if ALC acts before modulation, how could I transmit modulation in SSB ?

I am certainly wrong, I did not change hidden menu values and did not make any board modification.

Does someone could give me some basic explanations, I perhaps could better understand my TX and have a better spectral use.

Tnx for reading;
73 QRO.
Jean - F5ALJ

> Martin - G8JNJ
>

Unfortunately I don't think that this helps with Jean's problem. If I understand him correctly he is getting full ALC indication with no speech input.

Assuming that there are no other inputs to the radio. from a computer for example, then is sounds like rf feedback is causing the radio to take off. Try reducing the power to a low level or running into a dummy load and see if the problem goes away.

Another possibility is that if you have a switch box or something like a 'Rigblaster' connected you may have intrduced a 'hum loop' and it is the buzz from that which is causing the modulation.

20914. Using CT-62 and linear

Yahoo group: FT897 (2007)
Date: 2007-12-09 10:10:51 UTC
From: vr2ax
Topic: 20914 Message: 20914

I wired together a small mini DIN-RCA adapter cable today and realised that the "TX GND" ground-on-transmit functions in all three modes, CAT, TUNER and LINEAR.

Is there any reason why one can't put together a straight through mini DIN-mini DIN interface, with a take off for the TX GND, so that both the CT-62 and linear control can be used at the same time?

I play with the digital modes very frequently (MFSK16, PSK31, HELL, and occasionally Olivia) on my FT-897.
I'm using the Rigblaster "plug & play", and MultiPSK or Hamscope. It all plays very well together and have had ZERO problems.

Good luck, and go for it! Fun stuff.

I've been using my FT897ND on PSK31 for sometime now - I find various programs are more or less better at decoding it. I use it on Linux and Windows XP.

I also use it on a few other modes - mainly RTTY / contests also Olivia. I even had a BPSK125 contact .. though it sends quicker than I can type ;)

PSK31 - I use Ham Radio Deluxe and it's companion DM780.
It's beta, but the PSK31 portion is quite stable and useful.

A bunch of us are trying to use 30m more, so come over and
jump in.

Hi Bob
I have been using the signal link box for a while with no problems.Initial set up I found that the connections on the front of the computer where too noisy so I used the ones on the rear (direct to sound card) started at a low volume level then brought it up slowly while in TX and the box switched straight into transmit .You do not need the radio on for this set up .
I then did the same for RX with radio on and all was well so as not to over load the PC.
Please do remember to set the mode in menu no 38 use User for the sstv and you have a dedicated psk and rtty mode for both usb and lsb .
On VHF / UHF you just leave it in FM and away you go .
Hope this helps any other problems email me direct and may be we can have a QSO.
Take care

20924. Xtal filters in FT897

Yahoo group: FT897 (2007)
Date: 2007-12-10 12:24:28 UTC
From: ok1fig
Topic: 20924 Message: 20924

Hello all,

I it looks that one or even two Inrad's xtal filters would mechanically fit into the tcvr. They would have to be wired-in, it means placed aside and connected with two thin coax cables.
Mainly Inrad's 400 Hz filter seems to be a big temptation for CW (Shape Factor 1.8, while Collins filters have 2.5 or so).
Did anybody thing of such a thing? Did anybode realize that?

OH yes, that works very well. Not sure if all pins are brought out
on an actual MOUSE cable (chopped from a dead or old mouse). But
extension cables, for some reason, have all 6 pins end-to-end.

And they're shielded! I've had to trim back the plastic around
the connector a bit to fit. My last attempt at a homebrew
version of a 'Serial SignaLink' I made my own cables using 'proper'
DIN plugs which eliminates the need to trim plastic, but soldering
those #@*& 6-pin data and 8-pin CAT plugs is tedious!

I used an opto-isolator for the switch to PTT, and a MAX232 to
interface the serial stream. Found some nice communications grade
transformers to isolate the soundcard audio. Works fine - total cost
maybe $10 (but I splurged on a nicer Hammond enclosure). For a
'homebrewer' it's not the labor cost, it's a benefit!

From: jjchones
Topic: 20926 Message: 20926

Does anyone know where I can find right angle pl-259 type connectors? I need then for the ft-897d to the AT897. I'm not looking for the common right angle adapters, I'm looking for the ones that attach the rg-8x or mini-coax at a right angle to the connector. These will allow the most clearance on the back of the rig. Hope I'm making sense. I saw a picture where someone used this type of connector on the back of their 897 and at897. Just can't seem to find them. Thanks in advance. K2LEX

DO NOT use right angle adapters, connectors, etc. I have in the past and found they cause problems with SWR and RF. I know they would be great to use and save space, but my advice is to avoid them, they are NOT the greatest thing since sliced bread!

Dennis:
There should be no problem inherent in a right-angle PL-259 style adapter. There have been, however, some that are not all that good. In particular, there have been reports of some cheap right-angle adapters using springs to make the connection internally. That's right, springs, with inductance and everything. Silly isn't it. I wonder if you got hold of one of those.
I wouldn't however, use any more PL-259 type connections on VHF and UHF since they're not constant impedance connectors and they don't always mate cleanly.
On HF, PL-259's are tolerable as long as you align them and tighten them properly (no, not with pliers either), so if the application is to simplify installation of an HF tuner, I'd say it should be fine. Assuming the use of a good adapter.

I have both Z100Ultra and AT897 from LDG, GREAT tuners... easy integration to both 857D and 897D. Power efficient. Fast and reliable operation. Strong construction (not beautifull).

If I buy another tuner, it will be LDG again.

> appreciate help from the group.

Help desk wasn't much help for me... Here's what you need:

1. CT-62 Cable.

2. FTBasicMMO software.

3. IF you DO NOT have a serial port on your computer you'll need a USB-to-Serial adaptor and you'll have to configure it as a COM port 1, 2, 3 or 4.

The FTBasicMMO was the only software I could find that would clone my 897D when I bought it, you'd have to check for updates on that but you can order the CT-62 from HamRadioOutlet.com... It was a bit pricy but mine has worked flawlessly. You can Google FTBasicMMO and download it. The software was about $18.00. I placed my order and was using it the next day.

Directions for cloning are on page 65 of the manual... They're geared for radio to radio cloning, but the software tells you what to do. It's a breeze.

The real beauty of programming via cloning is I don't have to push all of the buttons on the radio just to program ONE channel... just enter the info into a spreadsheet-like interface and it's good to go.

Hope that helps!

20936. Help with Purchase Decision

Yahoo group: FT897 (2007)
Date: 2007-12-10 20:20:04 UTC
From: Ron
Topic: 20936 Message: 20936

I have been a ham for many years but I have never purchased a new radio. At the moment I want to upgrade abd get something that would be great with the digital modes and portable since I like to "get out" in the great outdoors and operate.

My dilemma is weather to get an FT-817ND, FT-857D, FT-897D or even the FT-450. They all have pretty good prices on them now. Which do you think would be the best way for me to go? I currently have an SG-2020 that I use for portable ops, but I'm thinking about selling it to help finance one of the above radios.

PLease feel free to email off list if that would be better.

Thanks!

Topic: 20912 Message: 20940

I didn't see the original post but here it goes.
I'm new to amateur radio and the FT-897D and I cloned 2 radios yesterday
that were giving me grief.
I took my VX-7R and opened the Yaesu VX-7 Programmer program.
I copied the radio to my PC.
I exported that file out to a RDF file on my PC.
I closed the VX-7 Programmer.
I opened the Yaesu 857/897 Programmer program.
I imported the RDF file (I had to get creative with the columns and
column names) to the 857/897 Programmer.
Every time I tried to send that file to either of my 897's it would
automatically read an error on the unit.
Then I sent the info from my 897 to my PC, then sent the info from my
RDF file back out to the radio and it worked like a charm.
Both times.
It's nice to have my HT and my 897 synced so all my frequencies are in
the same positions and named the same.
I hope that helps.

Ron, I have owned a FT817nd and now own a FT897d. While the 817 is a great radio, very compact and operates well. It is limited on power(5w) I would go with the 897. Although, I have the capabilities to work digital I have'nt done so yet. I hear alot of people comment on this radio for digital and SSB operations. The best thing about the radio as with the 817 also is the capability of running off batteries. The 897 will run with 20w which will allow you to make more contacts. If you find a way such as an external battery, you will be able to run 100w. Unlike the 817 which I believe will only give you 5 or 10 watts max. For the money, I would go with the 897 unless you are only interested in QRP. Good luck with what ever you decide. By the way, look at the portable package I made up for camping. It's in the picture files under portable package. It will be for RV camping but can easily be removed from the case for Backpacking, experiment, have fun.

Ron <rkjewett@...> wrote: I have been a ham for many years but I have never purchased a new radio. At the moment I want to upgrade abd get something that would
be great with the digital modes and portable since I like to "get out"
in the great outdoors and operate.

My dilemma is weather to get an FT-817ND, FT-857D, FT-897D or even the
FT-450. They all have pretty good prices on them now. Which do you
think would be the best way for me to go? I currently have an SG-2020
that I use for portable ops, but I'm thinking about selling it to help
finance one of the above radios.

PLease feel free to email off list if that would be better.

Thanks!

20942. Dumb Question Time

Yahoo group: FT897 (2007)
Date: 2007-12-11 11:10:36 UTC
From: Joe
Topic: 20942 Message: 20942

How do I create a carrier from the 897D so that I can tune a Windom wire antenna with a Ten-Tec 229 roller inductor antenna tuner/811H amplifier?

The only way I generate any carrier is when I go into AM mode. With my TS-2000, I just put it in CW mode and key the mic...I then can tune and load the tuner/amp. That doesn't work with the 897D.

I have the 897D connected to a relay buffer from the CAT port. The relay buffer then is connected to the relay on the amp. The buffer and amplifier *are* being activated, just no carrier output from the radio. (Hope I am clear!)

BTW...I can carry on a perfectly good SSB QSO, so the radio works fine.

If you key the mic in FM or PKT you will get a full carrier power output. You can get the same result by grounding the 3.5mm pin on the rear panel. Check the manual.

This will blow your finals soon. Turn the RF Power down to 10W in the menu for tune up. Even that will carry some risk, but less than tune up at full power.

I really agree with MSG on the 897, unless you're blessed with really good operating locations and antennas.

My 817 is really great for travel and casual operating, like on a business trip to Europe, where there's limited time to get out, you want to walk, and there's lots of interesting "local." During the last sunspot max, I really had a ball. BUt it hasn't been out much lately.

The 897 goes to trips in the Carribean where it does exactly what MSG suggests - works from the beach on batteries for 5-6 hours, with a no fuss charging system, and if I can get a car to a good operating position, works with 100 watts from the car off the car battery.

It is a true grab and go radio, with the power to get things done under marginal conditions. It ain;t a lot of fun to back pack, although I have a waterproof neoprene case on an ALICE pack frame and have carried it as far as 5 miles on a hike, but unless you're a real backpacker, it may not be so great. If you're not walking far and not backpacking, you can mount a bracket to the side for an antenna and carry it Heathkit lunchbox style walking around in relative comfort, and I do that at the beach alot.

They're both good stuff, but I'd bet you miss the 20 watts of the SGC alot.

Happy shopping.

Scott

Maybe I have missed something but why would'nt you just put the radio in CW mode and close the key to tune it?

Also, why would it blow the finals if you key it in FM mode?

Isn't it common practice to tune a radio with the lowest power setting and then increase power AFTER it is tuned?

If your intent is to do mobile/portable work with it, your best choice in my mind is the LDG AT897 auto tuner. It straps on the side just like the stock Yaseu autotunner (which most of us recommend you do NOT try) so it doesnt add to the parts you need to carry. Tunes 10:1 SWR's (reasonablly wide), doesnt use power when not tuning, Has memory tuning, comes with all cables needed, and will pass the CAT port thru the device so you can still attach other things to the radio. And it is fairly reasonable priced.

There are Better tunners, there are worse, but I think it is the best for your mode of operations.

From: Chris Baker
Topic: 20942 Message: 20947

I use two methods.
The first is the best, a MFJ noise bridge to manually tune the ATU for minimum noise = good match.
or if I want to radiate I switch to AM, with AM mic input in the menu at zero, AM power down to minimum in the menu.
approx 5W carrier.
of course there is always CW on low power!

The simplest way to generate a low-power carrier with the FT-897 is to put the rig in AM mode, and key the mike (automatically limited to 25 watts).

From: James Hunt KI5DQ
Topic: 20949 Message: 20949

Let’s look at the technical facts on SWR and tuners...

Yaesu designed the FC-30 Tuner with a maximum correction factor of 3:1 SWR for a very good reason.

As indicated below message, the LDG AT897 has a correction factor of 10:1. Does anyone know the incurred losses?

Looking at worst case situation of 29MHz, 100' of RG-8, an antenna with a 1:1 SWR will have a loss of 3.0dB overall. If your antenna has a 3:1 SWR, your loss is 4.4dB. If your SWR is 10:1, your loss is a whopping 12.8dB.
If you’re using 50' of RG-58, the losses are about the same as 100' of RG-8.

Under these conditions, less than 12% of your transmitter power is being radiated by the antenna. Translated 100watts output with 12% efficiency is 12 watts ERP. With 20 watts output with 12% efficiency is 0.024 watts ERP.

This is WHY Yaesu engineered the FC-30 with a maximum correction factor of 3:1 SWR. If your antenna mis-match is greater than 3:1, you need to go FIX YOUR ANTENNA.

The LDG AT897 boasts on having heavy duty components - reason is because the components act as a heat sink from all the wasted RF power they have to dissipate as heat.

Any antenna tuner is utilized to make the transmitter happy at a nominal 50 ohms load, regardless how good or poor the antenna is.

I proudly own a FC-30 and FC-40 and never will consider an AT897.

20950. Re: Help with Purchase Decision

Yahoo group: FT897 (2007)
Date: 2007-12-11 22:33:08 UTC
From: Copyvideo
Topic: 20936 Message: 20950

Hello Ron

Like you I had never before purchased a new rig, but took the plunge this year because finals for my hybrids were more expensive than the rigs were worth. So I sold up and went looking.

For my money the only choices were the Icom IC-706MKIII, and the Yaesu FT-857D or FT-897D. These are very similar rigs. I decided on the 897 for the following reasons.

a) I have to admit a bias towards Yaesu rigs - owned a few and never had a brummy one, even though they were all secndhand
b) The menu system is in my opinion superior to that of the Icom. Much easier to use, and I think more intuitive
c) That left me with the 857 vs the 897. I went for the 897 because age has wearied my eyes, and it's nice to have a large front panel and screen. The buttons aren't cluttered and so close together that I touch more than one at a time.
d) I cannot have anything more than a modest antenna farm - no tower, so it was pointless spending huge bucks on a super rig.

Never having owned either of the other two radios I can make no comparisons, but can assure you that I am very pleased with my purchase.

One of my ham mates who lives not too far from me, recently purchased one too, and is of the same opinion as me

Overall, a very nice rig at an affordable price, and very easy to program. I like being able to put an alpha-numeric tag on each memory channel too.

> The LDG AT897 boasts on having heavy duty components - reason is because the components act as a heat sink from all the wasted RF power they have to dissipate as heat.

Ah, I think that you may need to do a little reading on how a tuner works. This one line implies that there may be some incorrect assumptions being made. The reflected power is reflected again, not simply turned into heat. There is some loss from the tuner but nowhere near what your post appears to assume. The largest factors in loss are line loss and ground loss. The tuner adds some but not a material amount.

Maxwell describes systems designed for satellites with antennas that had horrible SWR figures yet the system overall was a very efficient emitter due to focusing the engineering on eliminating line loss.

I can take a hamstick and tune it for 1.1 SWR. Guess what, it isn't going to radiate as well as a better placed longer random wire.

Loss due to poor SWR is one of the last factors that one should focus on when tuning a setup.

It lets you use the internal power supply to power other equipment,
like a tuner, as well as the 897. I've done it using powerpoles and
it's nice to have one supply for the radio and my SGC237 tuner.

Thanks Nathan and the others that responded to me personnally.

Another technical tip:
Depending on the type of coax the individual is using, the feedline will actually MASK to a certian degree the actual SWR. Example, RG-58 and some types of RG-8 with a 1:1.1 SWR at the transmitter end may actually be much higher at the coax/antenna feedpoint. Reason, the coax loss factor. High quality feedlines will always show a more relistic SWR at the transmitter end due to less feedline loss.

My mobile installation utilizes LMR-400, not RG-58 for all antennas - HF, UHF and VHF. Reason, 100% sheilding which keeps the RF away from the sensitive vehical electronics. My home installation utilizes Andrews LDF4-50 and LDF5-50A Heliax for all frequencies 3.5 - 800MHZ with LMR-400 pigtail (for flex points). Reason(s) weak signal work is easier due to less line loss and less stray RF in the shack. All my antennas are physically TUNED to the operation frequency which I do not use any tuner at all except on the extreme band edges of 75 meters.
Much of this antenna / transmission line fundimentals can be found in antenna or the ARRL Handbook.

With tuned antennas and not using a tuner, you will enhance your communications.

> If youâ□□re using 50' of RG-58, the losses are about the same as 100' of RG-8.

I think that your "technical facts" have gone a little astray here:

100' of RG-8 will have much less than 3dB loss at 29MHz, in fact less than 1dB in a matched system. In fact 100' of RG58 will only be about 2dB!!!

Hi
James
How true the antenna and coax is more important then the radio.
In my case most of my portable antennas use twinlead and this is where
the tuner comes into play.

> Depending on the type of coax the individual is using, the feedline will actually MASK to a certian degree the actual SWR. Example, RG-58 and some types of RG-8 with a 1:1.1 SWR at the transmitter end may actually be much higher at the coax/antenna feedpoint. Reason, the coax loss factor. High quality feedlines will always show a more relistic SWR at the transmitter end due to less feedline loss.
>
> My mobile installation utilizes LMR-400, not RG-58 for all antennas - HF, UHF and VHF. Reason, 100% sheilding which keeps the RF away from the sensitive vehical electronics. My home installation utilizes Andrews LDF4-50 and LDF5-50A Heliax for all frequencies 3.5 - 800MHZ with LMR-400 pigtail (for flex points). Reason(s) weak signal work is easier due to less line loss and less stray RF in the shack. All my antennas are physically TUNED to the operation frequency which I do not use any tuner at all except on the extreme band edges of 75 meters.

Looks like there's some heavy metal about !

Only at vhf , can you have the luxury of a near 1:1 match across the whole band, with 'your' coax fed array. Most stations are using so called , HF multi band arrays , with a defined band with , may be to -3db 25% reflected power is a swr of 3:1 , 50% reflected is swr 6:1 .. The R8 is specified at 10% reflected power , giving 2:1 and acutally state 'dont' use a atu to extend its range ...

20% reflected power is about as much a good coax line should be asked to take .as this amount of miss mach will cause the pa to fold back , it needs to be addressed by a auto matching unit AMU, but who'd buy radio with one of those ?

A antenna tuning unit, ATU as its name implies, should be at the antenna end of the coax , offering a resolve for the antennas `complex impedance' to a |Z| 50 ohms ,leaving it's 'little friend' the AMU to iron out the bumps in the coax, thus keeping the pa happy!.

James:
I agree with the other post that your number appear to be in error.

29 MHz, RG-8 (9913), 100', 1:1 SWR = .67 dB, 85.7 W, 0 dB due to SWR
29 MHz, RG-8 (9913), 100', 10:1 SWR = 2.5 dB, 55.8 W, 1.9 dB due to SWR

29 MHz, RG-58, 100', 1:1 SWR = 1.9 dB, 63.8 W, 0 dB due to SWR
29 MHz, RG-58, 100', 10:1 SWR = 5.4 dB, 29 W, 3.4 dB due to SWR

The numbers above show that the loss due to SWR isn't all that bad, but that's not the whole story. These calculations are for SWR due to impedance mismatch and not any reactive components that occur due to the antenna being out of resonance, so the losses will usually be greater. While I wouldn't seriously consider using 100' of RG-58 to feed an antenna with a 10:1 SWR, doing so with shorter lengths or better cable may be a reasonable trade-off, particularly for portable operations where the line is usually short.
Again, that's not the whole story since the loss in the tuner depends on the tuning solution found, the radiation resistance of the antenna, and other factors.
While it's always best to have a resonant antenna and low SWR, not having low SWR on your line is not fatal by any stretch and antennas with SWR's above 3:1 can still be quite usable.
As for heat dissipation in the tuner, that depends mostly on I/R and dielectric losses, so larger and better quality components and conductors result in less loss. Other than the range of solutions the tuner can achieve, this should be the driving factor in selecting a tuner.

It took a while, but I found the answer was a loose
plug in the base of my MD-200 microphone. Apparently, this
loose plug would affect the radio on startup; regardless
of which subsequent mic was plugged in.

The loose plug was the very tiny DIN connector from the mic
to the base. The pins are barely long enough to reach the
connections and only a very small 'gap' can cause
problems.

Everything 100% working now; mic gain back to 50% setting.

Jim . . .

Good points, but you forgot to address the constant-running fan, lack of memories, and lack of latching relays in the FC-30.

20969. Bias Currents Revisited ☐ Alignment Day for brand new rig

Yahoo group: FT897 (2007)
Date: 2007-12-13 08:40:14 UTC
From: Axel Bak
Topic: 20966 Message: 20969

This may be of interest for those who were involved with big out-of-the-box bias-misalignments of the pre-driver, driver, exciter and final stages of either FT-857 or FT-897 rigs and for those who are interested in the general technical evolution of these rigs. I discovered a few interesting things lately, IMHO.

Yesterday I opened up my brand new FT-857D, serial number 6L660991, European version. I have been through the bias alignment procedure before with my former 897D, which was terribly underbiased (idling currents too low). This topic has been extensively covered already.

Earlier evolutions have shown that Yaesu changed the drivers (from 2SK2973 to RD01MUS1) and the exciters, or pre-finals (from 2SK2975 to RD07MVS1), which was a large improvement.

In my new FT-857D, I discovered another migration, this time in the final stages. The pair of HF/50MHz final transistors changed from 2SC5125 (Mitsubishi) to 2SC2782 (Toshiba) and the 144/440 final transistor changed from 2SC3102 to RD70HVF1.

The Circuit Diagrams and Block Diagrams that came with my new FT-857 have very different opinions on what should be found inside. The Block Diagram shows first generation info, including the long "blown away" drivers and exciters 2SK2973 and 2SK1975). The Schematic Diagram comes up with second generation info (new drivers and exciters RD01MUS and RD07MVS1), but does NOT include what I found inside: The 2SC2782 (x2) and RD70HVF1 final transistors.

Besides, the Block Diagram speaks really funny karaoke-English: The variable resistors for adjusting the idling-currents are marked "IDOL ADJ"! I fell from my chair when I read this!

And.... as far as I know, there is only one service manual, dated 2003, that shows the recommended bias currents. But are they still accurate for my new FT-857D with these new final transistors? This is where my technical knowledge ends, and my first question appears:

>>What would be reasonable bias current values for the 2SC2782 (x2) and RD70HVF1?

This question is sort of urgent, because it is right here where I discovered shocking values in my new rig. According to the 2003 service manual, the values should be 300mA for both, though some techs recommend 400mA. Well, my pair of HF/50MHz finals (thus 2SC2782) showed 560mA, and the 144/440 final (RD70HVF1) showed 1000mA!

I was pretty confused about this Final Situation, so I didn´t change any bias currents here. I closed the cabinet and started reading the datasheets. But I don´t have a clue.

Any comments on this are more than welcome!

73,
Axel, PA1XL

20970. Re: [FT897] Bias Currents Revisited – Alignment Day for brand new rig-(Not!)

Yahoo group: FT897 (2007)

From: kc3vo@aol.com
Topic: 20970 Message: 20970

I would say your bias currents, with the new devices, are OK! --The new VHF/UHF output is a FET, and it requires much more idling current for proper gain and low distortion. If you attempt to set bias to the figures used with the bipolar device previously used, performance would suffer. The new HF/6 meter outputs are more similar to the old parts, therefore have similar bias settings, and although they will generally perform with bias as low as 200 ma., current near the measured value gives lower distortion. (Do not attempt to interchange new vs old VHF/UHF parts, as the bias circuit is also different!)-73, KC3VO-Bob Curry

20972. Cable for AT-897

Yahoo group: FT897 (2007)
Date: 2007-12-13 12:07:38 UTC
From: dyarnes1
Topic: 20972 Message: 20972

Hi All,

Somehow I have managed to lose one of the connecting cables for my AT-897. It's the small one that goes from the "OTT" slot on the tuner to the "ACC" slot on the FT-897. In my traveling, I apparently got separated from the cable. I'm not even sure exactly what it is, but it doesn't seem like it would be that complicated. Problem is, I'm not sure exactly what the connections are, and the manuals don't seem to describe it sufficiently. Does anyone know if this could be easily duplicated? If so, what connectors and how should it be wired.

Thanks for any help.

Dave W7AQK

Hi Dave. As I recall, what you are describing is the "Y-ACC" cable. Point your browser to http://www.ldgelectronics.com/discontinued_manuals/yacc.jpg for the diagram.

Ken and All,

Yep! I just found the missing info by burrowing down deeper on the
LDG website. I had the XCVR end info, but hadn't seen the tuner end
conncection info. It wasn't in the manual, but they do have it on the
website as you pointed out. Thanks a bunch for the response.

Hi Bob,

yeah, I think you are right. I will leave those currents as they are now. I am still wondering however, why they replaced the HF/50 final for a Toshiba transistor. But I guess that will remain a mystery.

Hi Axel,

It is curious that the ICOM Pro III has recently also dropped the 2SC5125 in the PA amplifier and current models now are arriving with a re-designed PA using a pair of Mitsubishi RD100HHF MOSFET devices. I would imagine that vendor sources for the 2SC5125 either have low inventory or they are being phased out. No one seems to know for sure though...

Ah, well then, that explains it. Looking at the spec pages from Toshiba and Mitsubishi it looks like the Toshiba 2SC2782 is a pin-for-pin and ceramic flange twin of the 2SC5125. It probably would not be a big deal to use them as direct replacements should/when the sources for the 2SC5125 dry up. I wonder what differences appear in the schematic for the new PA with the Toshiba devices. From the anecdotal information that Axel received with his rig we may have to wait for a while to see.

Hi everyone,I'm new to this group and to the FT897.
This question is for any RV'ers with HAM Transceivers in their RV. I am setting up a mobile system around the Yaesu FT-897D for use on the road. I don't really know what bands I would be interested in for I just received my license(NN2M) and I'm a real greenhorn. I am interested in DX CW operating QRP but would like to experience all possible modes and bands if that is feasible with a mobile/simple base antenna. My question is what is a good antenna or antennas to easily haul around in a RV and to setup for a week or two at a time.

Don't know your budget, but I would look into the screw driver mobile HF antennas. The "High Sierra" brand is pretty popular.

Another great place to do some research on mobile HF is:

http://www.k0bg.com

Alan has put together a web page that should be required reading for anyone interested in HF mobile operations.

Good luck,

Eddie,

First, you should go with a motorized antenna. Go with the most radiation efficient one such as the Hi-Q Antennas Hi-Q-5/80 RT. I have over 15 motorized antennas from different manufacturers (including the ATAS) and the Hi-Q is the best performer.

Second, RV's are often an challenge since many are just a fiberglass shell on a frame, i.e., having a good RF ground isn't often easy. Here you need to study your vehicle and strap it well. Minimize the length of the base of the antenna from the RF ground. Often, this means you mount near the rear or front bumper.

Third, use Type 77 ferrite beads on BOTH ends of your coax and motor leads. Amidon FB-77-1024 is my favorite. Avoid Type 43 and split beads.

FWIW, the difference between the ATAS and the aforementioned Hi-Q antennas on 40 m is about 4 S-units (24 dB). I prefer to radiate rather than heat the world ...

I believe this parameter is retained in the memory by band.

Try setting it for the band in operation.

If you will go through each band, I believe you will find it may vary in the setup memory.

I just checked mine, and I have overcome that problem in the past. I think this was the solution.

Hi all,

In my case, it works fine, but I remark that every time I make a [Scop] in (h) menu when I change the [Step] option by [C] button , it changes automatically and remember the step inside :

- menu 82 (ssb Step) if i am in ssb mode
- menu 52 (fm Step) if i am in fm mode
- menu 6 (am Step) if i am in am mode

So, perhaps it can help.

Topic: 5358 Message: 21001

I just received a 300Hz and a 2000Khz filters from Inrad. Haven't put them in as of yet.
Can anyone tell me which menu settings need to be changed for them to work ?
It's faster and easier to ask than read the manual...

Thanks
Randall

Subject: [FT897] Filters

Hello all.

I am going to put the CW, SSB, and TXCO filters in my 897 here soon.
Does anyone have any recommendations for filters? I know W4RT has some cheaper.

I am all open to suggestions.

Thanks

Steve/KC8LQV

From: William Tsai
Topic: 20986 Message: 21002

Hello Eddie,

I have tried at least two screw drive type mobile antennas. They work ok. I would suggest looking into the HI-Q series. URL www.hiqantennas.com

Bill (KI6CYH)

Eddie Dunn <jedunn@...> wrote: Hi everyone,I'm new to this group and to the FT897. This question is for any RV'ers with HAM Transceivers in their RV. I am setting up a mobile system around the Yaesu FT-897D for use on the road. I don't really know what bands I would be interested in for I just received my license(NN2M) and I'm a real greenhorn. I am interested in DX CW operating QRP but would like to experience all possible modes and bands if that is feasible with a mobile/simple base antenna. My question is what is a good antenna or antennas to easily haul around in a RV and to setup for a week or two at a time.

Get your self a Whatsup meter and put it in line between the battery and radio. It will read about 10-15 different parameters. I run an 18 Ah battery but, have not had a chance to experiment. I just finished setting up a Portable Package which can be view in the pics section of the 897 group. Good luck and I hope Santa is good to you.

Date: 2007-12-18 02:13:15 UTC
From: kc3vo@aol.com
Topic: 21005 Message: 21005

The operating time, as far as transmit ability goes, using a 12 volt 17 AH lead-acid type battery, is not likely to be much more than what the YAESU internal batteries give, but it will weigh more! Due to the external battery having a lower voltage, it will reach the 11.5 volt point before all capacity is used. The FT-897 transmitter may not perform properly below 11.5 volts. the YAESU battery starts out at 15-16 volts, and gives up its capacity by the time it gets to 11.5 volts, whereas the lead-acid battery starts out at perhaps 13.2 volts, and is depleted of advertised capacity at 10.8 volts, so you have almost 1 volt of capacity that cannot be relied upon to operate the transmitter properly. (a seven-cell lead-acid battery would be nice)--This is why you cannot use all the capacity of the lead-acid 6 cell battery.--73, KC3VO-Bob Curry

21006. Re: [FT897] Santa

Yahoo group: FT897 (2007)
Date: 2007-12-18 03:27:52 UTC
From: Tim Lyons
Topic: 21003 Message: 21006

Well, from personal experience, the battery will last a good long time (this is purely a relative {no pun intended} measure). I first saw the 897 in the store in Akihabara, Japan. Loved it!. I made a trip to the states in late 2003 and saw it in HRO in Burbank. I wanted it for Christmas, but I knew better. My kids were just that, kids. And, the wife at the time, didn't work. In fact she still doesn't. Anyway, I waited till Christmas 2004, nothing. 2005, still waiting. All this time I had been saving up for the radio. Now, at this time, I was planning on dropping more than $1,000.00 U.S. for it when I got to move back to the states for good. So, when Christmas 2006 rolled around, I didn't expect anything. And got the same! Well, I moved the family back to Southern California and after the dust of the move settled, I ordered the 897D, the AT-897, FT Meter, one battery and the charger. I un-boxed the radio, set up the G5RV and dual band antenna (VHF/UHF). Powered it all up.
Worked fine, loved it. I decided to charge up the battery and planned to go on the air later with it only on battery. The wife got a look at the (my Christmas gift to myself) and freaked out. After taking the wife and kids to spend Christmas and New Years on Oahu, she was upset that I would dare to spend that kind of cash on myself.

Well, she is no longer in the house and I did get to go on the air on the battery. It was about 2 days after she freaked out about the radio when I went on with the battery. Ran it for about 54 minutes and she was sweet. I shut it down and went on a work trip for a week. When I got back, she was in court asking for a legal separation. She is out of the house. But, the next time I got to power up the radio on battery (off the initial charge) it was 2 months later.

So, to make a really long story short, the battery has a bit more stamina than my (future) ex-wife. Just in time for the sunspot cycle to start it's upward trek.

So, enjoy the radio and Merry Christmas to all and to a good night!

From: Curt K
Topic: 5358 Message: 21013

The Inrad filters work great w/ the FT-897D. I have the 500 Hz for CW/RTTY and 2.0 kHz for SSB. I find that the 2.0 kHz filter makes only a marginal improvement over the stock ceramic 2.3 kHz filter, even in crowded conditions. So I'd recommend getting the Inrad 300 Hz and 500 Hz filters and not the 2.0 kHz filter. If you do much RTTY or CW, you'll be glad to have the narrow filters. If you want just one narrow filter, then I'd recommend the 500 Hz as 300 Hz may be a bit narrow for CW.

This group is very useful. There's no such thing as a dumb question.

Gooday Joe

A Useless Answer (in keeping to the topic)

I don't have any spares but from the 897 Service Manual:

Handle RA0412500
Holder Handle (x2) RA0412600
Screws (x2): Binding Head Screw M4x20B VXSTD P/N U20420007

Bail: Stand RA0398200
Foot (x2) R3100700A
Screws (x2) Binding Head Screw M4x8B VXSTD P/N U20408007

It might be worth asking Yeasu about part numbers, it may reduce the amount
of thinking needed.

My appologies to all who have read this useless answer to a useless question
but then they didn't ask the question, did they Joe.

I agree with what Petr said. If I were to reply (I wouldn't!), I would only say, "look in the manual, page whatever." I mean, the next thing somebody will ask is "Please ring me, I want to know where the on-off switch is."

The problem is that many internet mail-lists are dumbing down, some really stupid questions are being asked. After all, a radio amateur is supposed to be somebody with a reasonable level of technical knowledge.

I do agree, the whole of the radio amateur service seems to be on an accelerating downward slope. I still remember the day's of Don Stoner and Walt Henry as we were grinding our own xtals to make our home brew SSB equipment.Nothing at all was available over the counter. Even the full license examinations at least in Germany and later Australia were quite tough. You almost had to be a radio tech to pass them. In 1964 I build my first home brew SSB transceiver hi, it did work, probably better as most over the counter equipment you can buy today. Winding transformers for dc dc converters etc. So many of the questions I find today in the ham forums seem to be asking the obvious, never mind I still enjoy the forum even if I have to shake my head from time to time. Well that's the opinion of an old timer.

Hi Eddie,

If this is for portable use, and not mobile use, that changes
things.

IMO you don't want a screwdriver antenna for portable use.
I think they rely on using the vehicle as a counterpoise.
That would mean that you would need to use them with
radials.

The Buddipole would be more appropriate. Also take a look
at Force-12 Sigma 5 and Sigma 40XK. These are shortened
dipoles, and require no radials.

I have been researching antennas, and these are the ones
that I have found that seem well-suited to portable use.

I saw the Buddipole at Pacificon. It looks like it would
be very quick and easy to set up.

I would read the reviews of these antennas before making
a decision.

Rob & All:
One of our members brought his 25' telescoping flag pole to an event our emergency comunications group just participated in.

http://www.uncommonflagpoles.com/tfp25s.html

These are pretty robust and very well built. He also had an adapter to mount the buddy pole center insulator to the top of the pole where the ball or eagle thing normally screws in. We used that to put up my Buddipole antenna set for 40 Meters and had a blast with it.
I was thinking that this would be a possible option for an RV. They have a variety of mounts for it including a receiver mount. Wouldn't be hard to place a mount on the back or side of an RV and simply stick the flag pole in there whenever you want to (as long as you're not moving). Could be used not only to support a buddy pole but just about any other small antenna including inverted V's and such. Not particularly cheap, but very strong, easy to setup, and comes with an American Flag!
Just a thought.

21031. Re: Setting up a Base Station in an RV - What Antenna?

Yahoo group: FT897 (2007)
Date: 2007-12-20 16:22:53 UTC
From: dyarnes1
Topic: 20986 Message: 21031

Hi All,

As a motorhome owner, I have a lot of interest in the suggestions being offered. I also have seen some pretty ingenious setups at various ham outings and in RV parks.

A really good screwdriver antenna, like the Hi-Q, might be an effective solution. But, as has been pointed out, the ground plane aspects of many RV's is suspect.

A lot depends on just how "portable" you want the antenna to be. Are you going to set it up and leave it up for a while, or are we talking about something you would have to put up and take down every few days? My RV usage tends to be at one or a few locations for extended periods. I have an R7 vertical which I mount on a piece of heavy duty PVC (to get it up just above the top of the motorhome), and I lash it to the back of the motorhome. This works pretty well, but it wouldn't be nearly so good if I had to move every few days. It takes 30 minutes to an hour just to set up an R7 as to proper length, etc, and it takes more than a little effort getting it up in the air. But being a half wave type antenna, radials are not a problem. I think this setup would be much more effective than any screwdriver system.

I have a Buddipole system, but that is a horizontal system, and really should be raised up in the air a good ways to really be effective. Using it as a vertical is better, but it would be a quarter wave arrangement, so radials are very necessary. It's only one band too unless you go out and lower the antenna every time you want to change bands. As portable systems go though, the Buddipole is a very nice product.

The Sigma 40-XK is another good antenna, but it requires some coil and dimension manipulation to move around all the bands it is capable of covering.

None of the above, except possibly a screwdriver antenna, give you 75/80 meter coverage if that is important to you.

Of course, if you have some room to spread out a bit, a wire antenna, like the 44 or 88 foot dipole with balanced feedline, combined with a good collapsible pole might be the best choice of all. A sturdy 20 to 25 foot flagpole might be sufficient, but a really good choice would be a 40 foot Wonderpole (www.wonderpole.com). I use this whenever I can, and it works very well.

I would like to thank everyone that responded to my question. I received lots of good information and reference to a couple of websites that were very helpful. I guess my problem isn't so much of a mobile setup but more of a portable one for I will never be operating the radio on the road, only in campsites. I'm down to Tarheel, High Sierra, Hi-Q and Budpole antennas.

21036. Portable Telescopic pole

Yahoo group: FT897 (2007)
Date: 2007-12-21 01:55:17 UTC
From: kf4uga
Topic: 21036 Message: 21036

Since on the subject of portable setups I thought I would mention a good one that works for me. I found a near new condition fiberglass telescopic pole made by CRAIN INDUSTRIES INC. The model is called CMR for Crane Measuring Ruler and is available up to 50ft in length.It is used for measuring power line and pole height as well as pulling transformer switches/fuses out. The pole collapses inside itself to 5ft and extends to 40 feet,and is very light weight for that kind of height.The tip of the pole features a threaded insert to attach the hook for switch/fuse throwing , that works well for mounting the center balun of my 120ft wire dipole to. The added antenna top weight makes it necessary to drop a couple of the the top sections down to avoid it being floppy but still gives a good working 30 feet of height at that.I bought mine used for 20$ at the local flea market, one of the top section locking thumb buttons had came out.Thus I suppose it was rendered defective for normal use, but was a simple fix for my use. Just a thought for those looking for a good temporary or portable wire antenna setup for camping like I use mine ,or for RV use.

Rob & All

The problem I have is that some of the RV parks I frequent are close together. You have RV's on each side and in the back of you separated by only 8 feet in some cases. The idea of placing a antenna up a flagpole, especially one that adjusts would be good but the system would have to break down into a small package on longer than 4 feet. Another possibility would be a screwdriver mounted on the back ladder at the top. I would have to climb the ladder to attach and remove the whip. I do like the idea of a motorized tunable system that once up and operating I can work several bands and not fight trying to manually tune the system each time I want to change bands, I'm lazy :).

You do not necassarily have to climb. There are a number of motorized mounts that will rise up or go down at the touch of a button. Here is a mount I think would work along with a roof top railing mount

We spend 4 to 6 months per year in our motor home, so I've been following this thread with interest. Some good thoughts,(like the vertical dipoles) but it seems like some of the suggestions are coming from people who don't do extended motor home living and are not really aware of the problems.

I've looked at and tried lots of options and never found the right solution. One of the main problems is that my coach is fiberglass and that presents counterpoise problems for most verticals, including screwdrivers. Forget about laying ground radials into the next site. And stringing up wires is simply not an option at many RV parks. You will see many ground mounted satellite TV dishes in RV Parks, but setting up a BuddiPole gets you an invitation to take it down or leave - "no clothes lines!". Ideally, I would like to have multiband capability without having to go outside to reset jumpers or climb on the roof of the MH.

A couple of things I'm looking at - Tarheel Antennas offer some nice approaches for motor homes - automated or manual tip-up mountings and a "foil tape w/ conductive adhesive" approach for the counterpoise. It's a bit of a spendy solution however.

I'm also looking at a Par End-Fedz as a sloper (painter's pole on the rear ladder to the front of the coach) but unfortunately, the 10-20-40 is a QRP only (5W continuous) antenna. Dale says they have built a 100W 10-20-40, but never put it into commercial production. Boy would I love one of those!

Are there some more fulltimers-extendeds who can jump in here with what they've done? Would like to hear from you! Any comments and suggestions appreciated.

Hello Rick:
reading your post the 1 idea that has come to mind is one of the screwdriver antenna companies makes a dipole antenna using 2 screwdirver antennas and tunes both sides of the dipole together I believe. This would eliminate the radial problem and only leave you with how to extend a mast high enough to make it work. for that you may look at a portable flag pole such as sold at Harbor Freight tools(I think they are 16 and 25 foot). the cost of the dipole antenna I will guess is gonna be a little pricy as you are buying 2 screwdriver antennas but its' a thought. the fiberglass coach part of your MH will have little effect on the antenna, mite be worth looking into, Bad part is I can't tell you how well they work, I am sure eham reviews and the MFGR will tell you they work great best thing in the market today. anyway just a thought. The December 06 issue of QST has an article that might be helpful. Page 36, "The Octopus, a four band antenna for portable use." The article describes a method to mount four dipoles on a single mast, using an octagonal electrical junction box as the "hub" for the antennas. Each dipole is made with of a pair of helical antennas with 3/8x24 thread mounts. The antenna mounts on an extendable fiberglass pole, similar to those already discussed in this thread.

Rick,
I spend alot of time in my travel trailer. I do not have the same issues as you. I have set up my buddipole with not alot of problems. Mostly just curious campers stopping by to ask about it. It is alittle intrusive and I had a kid run through the counterpoise(even though I had it marked with bright orange surveyers tape) Could you not use say, an ATAS 120A with a motorized tip up mount, mounted to the top rung of your ladder and run a ground strap from the bottom of your ladder to the frame of the motorhome. Or maybe even mounting it up by the front drivers side window and running grounds from there. If you go to a place that installs communications equipment, I am sure they can assist you. I am thinking this type of setup would be good.

Just hold in on the Home button when you push the power button. That will do the CPU master reset. It will reset everything to defaults. V/M and power will reset the memories and certain stuff to the factory default. If you have the manual, it will guide you on page 65. If not, you can download the manual on the Yaesu website for free.

I'm also looking at a Par End-Fedz as a sloper (painter's pole on
the rear ladder to the front of the coach) but unfortunately, the 10-
20-40 is a QRP only (5W continuous) antenna. Dale says they have
built a 100W 10-20-40, but never put it into commercial production.
Boy would I love one of those!

Are there some more fulltimers-extendeds who can jump in here with
what they've done? Would like to hear from you! Any comments and
suggestions appreciated.

Some RV bodies are aluminum framed. It seems tapping into the frame
near the antenna feed point would solve some of the problems re: RF
ground - counterpoise.

21047. Portable antenna's

Yahoo group: FT897 (2007)
Date: 2007-12-22 08:55:44 UTC
From: John Randall
Topic: 21047 Message: 21047

For a simple portable antenna, I use 2 of those kiddie spring toys that "walk" down the stairs from toys r us. They can be stretched quite a bit and take up less space than a straight wire dipole.They can also be mounted on a vertical pole. Just add ATU and Balun. Its a bit difficult to solder them, but this can be overcome by using crimping tools....

Bruce:
The one thing to keep in mind about this is that using the frame as the counterpoise puts the RV and everything in it right in the middle of the antenna and anything connected to the vehicle is connected to the antenna and essentially becomes part of it. Whether you have RF problems at any particular location in the RV or with any particular items in the RV is pure chance and frequency dependent. That also puts anything that's generating noise in close proximity or direct contact with your antenna which results in more noise into the antenna.
Obviously, there's real problems trying to avoid this when operating from an RV and particularly when you can't deploy anything up and away from the RV. This is true of nearly all of the installations you hear about other than putting some kind of dipole (wire or Buddipole style) up and away from the RV.
One alternative that a friend of mine uses is to use an antenna on his vehicle that he pulls behind his motorhome. He happens to have an SGC tuner and antenna on that vehicle, but it could be anything. The advantage is that the antenna and counterpoise is separate from the RV and if you decouple (choke) the RF on the transmission line to the vehicle with the antenna, you minimize these kinds of problems. The obvious disadvantage is forgetting to disconnect the cable when you go out for dinner!

Hi Im Marty. I just joined !

I plan on getting a 897D for mobile and portable work (basically out of a back pack in the wilderness).

I am wondering if any one has suggestions on this, like best portable antenna to get, tuners, etc??

My Best,
Marty N7xhb

21052. Noise from FT-897D to other radios

Yahoo group: FT897 (2007)
Date: 2007-12-21 20:43:23 UTC
From: dj1tu
Topic: 21052 Message: 21052

Hello,

I found a problem with the FT897D. As I tried to work AO-7, I heard terrible noise on my TS850S (receiving at 29MHz), while I transmit at 145MHz with the FT897D. The S-Meter moved to S7, even if there was no output at 2m (ptt putted, by no sound at the mic / TS850S with earphone to avoid feedback). A few years ago I used my 30 years old TS700S and there was no increase in noise or S-Meter. The noise was present only at transmitting, while the PLL-noise is no trubble at receiving.

To find out the cause, I changed the power supply, the short wave RX and the antennas - but no big change.

The noise is most at 2m TX to 10m RX, felling down in strength down to 20m. Transmitting at 70cm gives only S3, while shortwave on 897 to 850 gives no effect, except in the same band.

Have someone found the same trubble? Do you know some cure, like oscillations on the 2m power amplifier, ferrits, blocking capacitors and so on?

Otherwise I like the 897, because it's a compact, all band TRX.

21053. Question concerning Ft-897D/ FT857D transceivers and satellite use

Yahoo group: FT897 (2007)
Date: 2007-12-22 14:59:40 UTC
From: noahcount_62
Topic: 21053 Message: 21053

I've been contemplating buying either a pair of FT897D's or FT857's
and setting them up for satellite use as well as HF. I know it's
possible to use a single transceiver with SatPC32 or HRD but I'm not
wild about not being able to hear my own downlink.
Both SatPC32 and HRD will let you set up two radios in a more
conventional full duplex arrangement. My question is this...
Will the Yaesu radios allow the computer or the operator to change the
VFO frequency while actually in TX mode? This would be important for
smmoth doppler corection. I've been getting conflicting information and
would like to know this before I consider the purchase of either model
of rig. One gent told me it was possible yet I read on the HRD website
that the radios locked frequency while in TX mode. A definitive answer
would be great.

From: n2fkf
Topic: 21054 Message: 21054

Hello to all in the group. I am new here so if my questions have already been asked, my apologies. I have been seriously thinking abt buying an 897D to use strictly for six meters. Would like to know personal thoughts with its operation on that band. Did get the chance to use one at a friends QTH and was very impressed. Also, would possibly use it as an IF rig for 222, and 903 and maybe the higher microwave bands. I am aware of the transverter mode via the menu and also the 5 watt power down feature. Thanks in advance.

From: w4wb
Topic: 21056 Message: 21056

Folks,

This forum is about asking and answering FT-897 questions, sharing experiences with the FT-897, etc. It is not about discussing the fact people ask questions. If YOU don't want to answer a question or help someone out, then fine. Just move on to the next message or hit the delete key, but please don't waste bandwidth commenting that you don't like the question or something negative about the person asking.

On the other hand, those having rather basic questions really should first read the manual. It is not the best written manual in the world, but it does actually answer most basic questions. It does that some time and effort to learn how to operate a modestly complex radio. If that doesn't work, the use the search engine for the archive for this Group. You have to use the web to access it. What some of you may not realize is that many people do not have ready web access, but still have only slow email downloads. Archive research is difficult for them as I'm sure you can understand.

Share your knowledge and help a fellow ham if you can! :-)

I too am looking for a solution to the RV antenna problem. I am a
full-time RVer. My 34' fifth wheel does have an aluminum frame for the body.

The tow vehicle is a 3/4 ton GMC pickup. The mobile installation
includes a SGC tuner and whip antenna which works reasonably well.

Perhaps my solution is long wire the whip when parked and run the mobile
transceiver with remote computer software. I think it will be kind of
strange sitting at my RV kitchen table talking to my computer.

21062. RV Antennas

Yahoo group: FT897 (2007)
Date: 2007-12-22 17:11:51 UTC
From: G. Lofstead
Topic: 21062 Message: 21062

Well, I have been doing Mothorhome Mobile for the last 20 years.
It looks like folks are forgetting that or do nor realize, the chassis is th "GROUND" side of the antenna. There is NO problem with RF "getting into" things in the Motorhome. You can get into the TV if you are in a low signal are using the crank up antenna with preamp. However, the chassis gives a good ground system for the antenna. I run my coax and control cable for the screwdriver antenna through the chassis frame. This keeps it clear of anything that may "reach up and get it" 8-) as you drive or when parking... I have worked all over the world moving and parked in camp grounds or National Forest locations and have lots of fun in the motorhome when mobile. The fiberglass shell has nothing to do with it, ignore it. Just make sure you get a short run from the base of the antenna to the chassis with RG8 or equivalent braid for the RF path. This is your main worry. Use a bolt on the frame if possible. Otherwise, a bolt from a bumper mounting screw will do.

Jerry
W3CDE
Mobile since 1954

Hi

I have been watching this thread. I use to live in a travel trailer.

Before I Upgraded

to General then Extra. The canopy was in bad shape. But what I did was
use a 24 ft fiberglass
collapsible to 8ft Telescopic pole attached where the canopy bars folded
down.
If I was going to do it again even in a RV unless I am mistaken I could
use a Buddipole attached with wire ties
for temporary use.
But here is a Screw Driver antenna designed for a rv at this link.

Hi

My lips are sealed now whats your phone number so I can call your wife:-)

Just joking.

My wife had watched me looking at the 897d for months. she knew I wanted it but

being a family man I just did not want to let go of the cash. It showed up on my desk along

with a MFJ Tuner. My wife is a Ham also so she knew I wanted it. I must have really been good this year.

She has also purchased some telescopic fishing rods so I can make dipole Antennas for portable use.

Along with a expensive smoker and a nice watch. Now to figure out what I am doing right so I can get more toys next year.

Make sure that you can prove a path to chassis ground when mounting your antenna. As in, use a multimeter to verify that there is a path to ground, don't just say, "I see metal touching metal, it should be fine."

I was all proud of my antenna mount that went to the bare aluminum shell on my truck but I've never got what I considered a good signal. Today I took the shell off to replace a turn signal (shell hides the bolts) and discovered the shell installer took great pains to hide from view the sticky gasket they used between the shell and the bed. The shell's clamp-down bolts that I saw touching metal in the shell turned out to hit a gasket or painted surface on the underside. I couldn't find a single point between the shell and the truck bed that would have served as a path to ground.

30 seconds with a multi-meter when I was installing the antenna would have saved me a LOT of debugging woe over the past year.

My fix was to run 1" ground braid under the washer on the nut to under the washer on the bolt side at each of the bolts holding the shell down. I also made sure to sand where the braid touched in case there was a clear sealant on the metal.

From: Dave Matthews
Topic: 21053 Message: 21074

Yet the rig is locked in TX mode with HRD. However if HRD is working right and you have the interface cables ok, then the smooth doppler shift should allow hands-free operation anyway.
Last field day a few of us tried using HRD with a FT-857 and an Icom 706. Setting up HRD for two instances of control was no problem. No great success on field day but the practice times beforehand were fruitful.

I currently am attempting sat comms with my FT-897, and there is one issue you should be aware of. The polling noise as HRD updates the rig is very annoying and makes it hard to read weak signals. Suggestions on the HRD site say to use shielded cable for the computer interface and also to add plenty of ferrite beads. I am working on that solution here, so-far beads alone are not enough.

HRD supports both the FT-857 and the 897, but I can't get either to do the A/B split in the satellite mode yet. Still learning.

It depends on the age of your 897. If it is a late 897D then you can't software wideband it. If it is an 897 (plain vanilla) or an early D model then you should be OK.

Just in case, I will send you the genuine hardware mods off list.

Hi Rick,

First of all A very Merry Christmas to everyone and whatever festivities you do celebrate if not Christmas.

Widebander will work on FT897and some D versions, Yaesu changed it under pressure from the FCC and the latest radios will not work with software widebanding. Someone might know the dates when they changed it but I would just try it anyway, you have nothing to lose.

Best regards

There are some basic checks you can do. Totally dead (as problems go) can be a good thing as they are easier to solve.

Check the fuses (or course), but you might want to change them just in case. I do have 1 fuse that when you check it with an ohm meter, it is fine, but once you draw some current through it, it opens.

Is you voltage too low. Not sure if this is a mobile or base, but sounds like a power source problem.

Hi Marty,

I think that the 897 might be too heavy for this (but then, I'm old) but with my 817 (and also when the 897 is avaliable) my favorite light antenna is the HFp by Ventenna (http://www.ventenna.com). I don't use a tuner with it, just an Autek VA1 that I pack along with me to tune the antenna up before I connect the rig. (Before folks beat me up about the Autek - It is a great field analyzer, not a lab-bench test instrument.)

I live in a little hollow so I do most HF while portable. Drop me a note if you like and I'll be happy to schedule a qso.

Yes it is...but...True to Japanese translations, it is poorly written and sorta lost me. ('Hiding a memory' is NOT deleting a memory channel, so when looking through the index for deleting a channel, one sorta misses that obtuse reference to deleting a memory.)

So...That is why questions get asked, and some people have the courtesy to helpfully answer, rather than posting a terse, "It's in the manual".

Merry Christmas all. Hope Santa was understanding about what you wanted and did not bring the lump of coal!

(Although, with the price of heating fuel now-a-days, a lump of coal might be welcomed in some houses!!)

One other thing to try. Is your backlight on the display lit? Mine will do that and not power all the way up. To get it back to running, unplug the A+ leads on the back of the radio, wait 5 minutes and reconnect. Then try to power up. Mine does that every once in a while and when it is in that condition, it is still drawing current so it will kill a car battery in a few days if the engine is not run.

21101. Polling noise under Ham Radio Deluxe

Yahoo group: FT897 (2007)
Date: 2007-12-25 22:02:27 UTC
From: Dave Matthews
Topic: 21101 Message: 21101

Merry Christmas everyone. When using the Ham Radio Deluxe satellite tool for doppler tracking, I have a polling noise issue with my FT-897, the same as I had last field day with HRD and a FT-857. There is a periodic polling 'squelch' effect if you can imagine, the normal background noise gets quieter when the communications between HRD and the rig occur (my guess that's when). During Field Day this was when the rig was controlled by a laptop, and yagis were about 20' away pointing at the sky. This current setup is on a tower style office computer into eggbeaters warming the clouds.

My CT-62 interface cable is shielded, but the shield was not connected! I tied the shield to ground, no difference. The RS-232 extension cable used is also shielded. Grounds are good in this upstairs office shack but I am about 12' above the ground rod. Trying different grounding makes no difference. Ferrite Beads on the comm cable, looped, etc. makes absolutely no difference.

This is a really annoying problem, and I feel there must be something elementary that I am missing either in the FT-897 setup or in HRD.

Any response is appreciated,
Dave KI4PSR

>
> Is you voltage too low. Not sure if this is a mobile or base, but sounds like a power source problem.
>
> Mike VA3MW
>

I had a similar problem once. Really had me scratching my head, for awhile.

Power supply checked fine. Fuses checked fine. Checked the connector
on the back of the rig, nothing. ???

Finally figured out the "socket" the glass fuses plugged into were loose
and making only intermittent contact. The good news was a simple fix,
just replace the fuse cord and all was fine.

Good luck with yours, and hope everyone is having a great holiday!!

21103. LDG RCA-14 Question

Yahoo group: FT897 (2007)
Date: 2007-12-25 23:35:08 UTC
From: Curt Givens
Topic: 21103 Message: 21103

Santa was nice and brought me the break out box. So I dutifully hooked it up to the data port on the 897D. I have some RCA to mini plugs (mono) so I connected the sound card in and outs with them taking the pin out from the CT39A package. Pin 1 (jack 9 on the breakout) to soundcard out and Pin 5 (jack 13 on the breakout) to soundcard line in. Used the cat function for ptt. Set rig to digital mode with PSK U selected. Only very faint races on the MixW waterfall and output was non existent even with the soundcard up most of the was and digital gain at 100.

Puzzled I thought maybe the outer connection on the breakout box were not connected to ground so I made up a set of cables with the center to tip and took both of the "shaft" connections to a third rca plug (center) and plugged it in for pin 2 (jack 10 on the breakout). Same picture.

Does anyone see something obvious or otherwise that I'm overlooking?

Hope everyone got their Christmas wishes and wishing you the happiest of New Years.

21106. Thinking of buying the 897D

Yahoo group: FT897 (2007)
Date: 2007-12-25 20:20:56 UTC
From: John
Topic: 21106 Message: 21106

Hello all,

Just joined this group. I am contemplating buying the 897D in about a month or two. What accessories should I plan on getting with it? I will have roughly about 1600 to spend on radio plus all accessories to get up and running with this radio. I will be putting a multiband fan dipole (80, 40, 20 15, 10) plus a long wire for recieving only. I am also a lot of distance from any VHF repeaters, so will be putting up a good 2 meter antenna as well. As well, we can depend on a lot of power outages in the area where I will be living, so can anyone help with suggestions on battery. I will also be doing ARES/RACES duty with this rig. I do already have a 2 meter mobile that I will be doing both mobile and base duty with. So, as this is my situation, any suggestions on what accessories, etc I will need.

Thanks for any and all info

From: Robert Sillett
Topic: 21101 Message: 21107

Hi, Dave.

Such chuff-chuff sounds are quite common in many receivers when data is sent across the serial port. For example, the Icom IC-R75 is quite susceptible to this. I too have noticed this with my FT-897.

The solution is to have the software program not poll the receiver or poll it less frequently. The difference is immediate and dramatic, although you do lose the ability to have any changes to the radio (i.e. frequency, S-Meter) reflected immediately on the computer screen.

Another option that can possibly lesson the chuff-chuff sounds is to play around the the various baud settings for the receiver. Try all the settings that your receiver and your software supports. Sometimes lower baud rates work, sometimes higher. It varies.

I ran across this problem several years ago with many receiver models and my Shortwave Log program until I added the ability to disable polling of the receiver.

Rather than give away fish, teach one how to fish.

Don't be lazy. Read the manual and work the radio if you really are interested in learning. Besides all that, it can be a lot of fun, not to mention how well you will retain what you have learned.

Have fun,

From: Dave Matthews
Topic: 21101 Message: 21110

Thanks Bob!

I appreciate the verification, and 'chuff-chuff' is a much better description of the sound I was trying to describe. I will look at HRD to see if I can make it poll less often. I thought I had found the setting, but it only permitted a maximum of one second, and when I selected that it didn't seem to take effect. So I probably need to look further. In order to do Doppler shift tracking of SSB satellites I imagine I need to poll/update at least twice a minute. But a much less frequent update would work very well for the FM birds, thanks for the tip.

I have tried different baud rates as you suggested, no difference noted there. Thanks again for your response and the description!

21111. When to Retune Finals?

Yahoo group: FT897 (2007)
Date: 2007-12-26 04:38:35 UTC
From: Ron
Topic: 21111 Message: 21111

I have the TS-530s. Once you tune your finals for a particular band at a particular frequency, when you begin changing frequencies up or down the band, at what point do you need to retune for transmission? I realize you want to do this when you change bands, but what about within a band?

Is it possible that you have the on-board batteries and they are completely discharged? My FT897 will not turn on even if connected to a power supply if the on-board batteries are completely dead. Don't know why.

Topic: 21113 Message: 21113

Hi Guys

I have an FT-897 with an LDG FT-meter and an LDG AT-200 autotuner going into a G5RV via RG213.

I can tune up when I select FM mode on any of the bands. When I change mode to LSB, USB I cannot get any RF power to the tuner.

DIG mode works on SSTV.

I've checked the RF power and all seems to be OK

Any clues as to what might be happening?

I've re-set the tuner memories, but am reluctant to do so with the 897 unless I have to, as it is quite a lot of work to re-set them all, but if thats the cure then I'll do it.

Thanks

I'd have to say that the 897 is very easy to initially set up, but
don't be fooled by the ease, to thinking that it is a basic rig.
There are a multitude of menu options for tweaking your rig to operate
like you want it to.

Most menu items are 2 level at most, and almost every imaginable
tweaking option is there for you.

Don't get me wrong I'm not trying to put you off - it's a great rig,
and I'm very happy with mine. I use a G5RV for HF, a 1/4W vertical
for 6m and a dual band vertical for 2m/70cm.

Hi, Joel, there's no carrier in sideband so no power out without modulation. You need carrier to tune that's why FM works, if you have the cable between the tuner and radio the tune button on the tuner should key the radio and generate a tone (CW) to get a signal for the tuner to work on.

From: joel
Topic: 21113 Message: 21116

Thanks Curt

Yes, I understand what you are saying. However, when I key the mic and talk into it, no RF is registering either on the FT-meter or the meter on the tuner. It's as though the SWR is so high that the protection circuits are cutting in, but on FM at the same frequency, the rig is operating correctly. and both the FT-meter and the tuner show similar SWR and RF power readings.

By the way the SWR meter on the tuner is'nt working either except on FM when I talk into the mic.

Thanks again

Tim R

Just to eliminate as much as possible, try going from the radio,
straight to a dummy load and see if you get the same results. If so,
I would look at the mic to be a possible problem, maybe try a known
working one,(mic)maybe borrow from a friend perhaps. good luck. scott.

Hi Guys

I have an FT-897 with an LDG FT-meter and an LDG AT-200 autotuner
going into a G5RV via RG213.

I can tune up when I select FM mode on any of the bands. When I
change mode to LSB, USB I cannot get any RF power to the tuner.

No RF on SSB is normal, unless you supply modulation. Tune in FM, or CW, if
you have a key connected, and close the key during tuning. When you speak
into the mike, SSB mode RF power should appear, following the amplitude
variations of your voice--read about how/why in the ARRL handbook-it should be
required reading for all of us! 73, Happy Holidays! KC3VO

Subject: [FT897] When to Retune Finals?

I have the TS-530s. Once you tune your finals for a particular band at a particular frequency, when you begin changing frequencies up or down the band, at what point do you need to retune for transmission? I realize you want to do this when you change bands, but what about within a band?

Ron,

I think you may have been aiming for one of the vintage Kenwood groups. Are you asking about re-tuning your antenna for lowest SWR or about re-tuning your finals on the TS-530? Rick has answered about the antenna SWR.

For the tubes, there is no re-tuning on the FT-897's solid state finals. For my trusty old Kenwood TS-520 I try to not wander more than 100 khz before re-tuning. I've seen the suggestion online to re-tune if you shift by 1 or 2 percent of your frequency.

Tim -
The radio is acting as it is supposed to. With no audio in, LSB and USB will not generate rf. Try whistling into the mike while in the usb or lsb mode and you will see that the tuner will tune correctly.

I have the same setup as you do. The AT200 tunes up a lot faster if I put the radio in the AM mode and key the mike for a second or two. Then I shift back to the appropriate side band mode. From USB you need punch the mode button 5 times to get to AM, tune, then 5 punches back up to USB. Use the AM mode as it only puts out 20 watts and is therefore easier on the finals.

It is apparent that most of you are not reading the responses or are not getting them. Joel stated he knows about LSB and USB modes not having RF unless you put modulation into the mic. Let's try another solution, I have none!

Dear Dave~~

It's the polling speed of HRD. I believe the subject was
covered in HRD forum last year.

Impact differs by radio. My experience is that noise
is eliminated with HRD set at 9600 for the 897
and 4800 for the 920. Leave 897 Menu 73 at 9600.
Laptop com ports also set no higher than 9600 as well.

Good DX in 2008!

Thanks Bill,

I have tried all speeds for the CAT interface (menu 019), and adjusted
packet speed menu 073 as you mentioned as well just now. I had
researched the HRD forum and found nothing that worked for my problem.
I'm still waiting for a response on the forum to a posting I made there.
I will try again ...

There is no difference when I try different com speeds, the
'chuff-chuff' amplitude makes the satellite tracking with automatic
Doppler tracking unusable for me.

Looking forward to 2008 as well!

Another thought I had is, where is the mic gain set, if for some
reason it is set at zero, or close to that, you will get no SSB
output, although you will have a carrier on other modes. scott.

Well, as far as power outages go, the internal batteries will take car of that. Just remember that you will only have 20w with the batteries. The LDG 897 meter is a good option. If you are using the fan dipole that will be resonant on each frequency that's good but, you may want to consider a antenna tuner like the LDG AT 897. I have not heard real good reviews on the yaesu AT that accompanies the radio. As far as filters go, That I feel is user preference and depends on what you intend to do. Good luck. I enjoy my radio, so will you.

John <jmurphy7411@...> wrote: Hello all,

Just joined this group. I am contemplating buying the 897D in about a month or two. What accessories should I plan on getting with it? I will have roughly about 1600 to spend on radio plus all accessories to get up and running with this radio. I will be putting a multiband fan dipole (80, 40, 20 15, 10) plus a long wire for recieving only. I am also a lot of distance from any VHF repeaters, so will be putting up a good 2 meter antenna as well. As well, we can depend on a lot of power outages in the area where I will be living, so can anyone help with suggestions on battery. I will also be doing ARES/RACES duty with this rig. I do already have a 2 meter mobile that I will be doing both mobile and base duty with. So, as this is my situation, any suggestions on what accessories, etc I will need.

Thanks for any and all info

With a resonant output circuit, retuning should be done any time that changing frequency results in noticeable plate current change, or power output reduction of over approximately 10 %. Generally, the lower frequency bands, 160 thru 40 meters, will require more attention to tuning when you QSY within the band. Keeping the output of these older vacuum tube radios properly tuned will give longer tube life, and cooler operation, with good output power.---73, KC3VO-Bob Curry

If somebody wanted to run for a long period from an external battery, I have found from google search that 16-volt lead acid batteries are available. Not cheap, but available. Prices start at about $200 for 65 ampere hour-16-volt AGM (glass mat construction) batteries. Assuming a 1:10 transmit duty cycle and 22 amps demand when transmitting at 100 watts, this should provide enough capacity to operate for about 15 hours before the battery voltage drops too low to be useful to run the FT-897D.

google on "16 volt battery AGM" to find sources.

Thanks for the replies guys. It seems I did not make myself clear enough at the start.

The problem is recent - a couple of weeks or so. I only noticed the problem when I went back to use SSB after a period not using it, while I spent most of my time playing with SSTV.

The radio works on FM and on digi for SSTV - getting QSL's on SSTV over 1000km with 50W on 40m. When I try SSB, there is no RF when I speak into the mic. The mic works on FM by the way, so I don't think there is anything wrong with it, but I'll borrow one to eliminate that possibility.

SSB works on 2m when I switch to my rotatable beam (sorry, forgot to mention this in the first post).

The G5RV will tune on all bands as expected, but only when I use FM and Digi. The only change I have made to the wire is getting it slightly higher, but the problem pre-dates that.

On 6m, I have the G5RV - yes, I know the wire is not the best option for 6m - and the vertical to choose from. Same problem with both antennas.

I've tried the dummy load both directly after the radio and after the tuner - same problem. This seems to eliminate the tuner from the equation.

By the way, the radio receives fine on all modes on all bands as far as I can tell.

The ARRl handbook should I agree be required reading. That was the first book I bought after I got my ticket in 1985, and have updated recently. Lots of useful info in there but none that solves my immediate problem with the 897.

Thanks again Guys.

From: Lew Phelps K6LMP
Topic: 21005 Message: 21133

The operating manual specifies use of a separate DC source with voltage of 13.8V. ± 15%, which would imply a maximum voltage of 15.87 volts. The "16 volt" battery to which I referred has a nominal open circuit voltage of 16.9 volts, so maybe it's not a good idea. My guess is that the rig would tolerate the slight overage from specification, since the specification is accompanied by a warning not to connect the rig to a 24 volt source, but having had this brought to my attention, I would want to get some "signoff" from Yaesu before I hooked the rig up to a nominal 16.9 VDC battery. I suppose one could cobble together a voltage regulator using a variable voltage regulator such as the LM317, run in parallel with one or several high-amperage bypass transistors, as is described in the 317's product specification sheet.

If the "16 volt" lead-acid battery has more than 7 cells, versus the 6 cells of a "12 volt" lead-acid battery, it should NOT be used with most amateur radio equipment, unless a REGULATOR is also included! Example: At full charge, an EIGHT CELL lead-acid battery (16 volt) is likely to have a terminal voltage near 19 volts! A 16 volt, 8 cell lead-acid battery will require about 18.5 volts to charge! The FT-897, like most similar amateur radio equipment, uses internal parts that have a MAXIMUM voltage rating of 16.0 volts, and can be expected to fail very soon, if operated at 18 volts. A 7 cell lead-acid battery, which could be charged at 16.0 volts, would be the best choice, as its operating range would be 16.0 volts at start, and about 12.5 volts at finish of normal discharge.---73, KC3VO-Bob Curry

Everything I have works...Take a couple deep breaths and start form scratch...Your antennas need to be close to resonant unless of course you use an LDG tuner then a fence post will do...double check all connections to be sure that they are not backwards...With 3 radios surely one of them will work...

Subject: [FT897] Re: strange tx error

Thanks for the replies guys. It seems I did not make myself clear enough at the start.

The problem is recent - a couple of weeks or so. I only noticed the problem when I went back to use SSB after a period not using it, while I spent most of my time playing with SSTV.

The radio works on FM and on digi for SSTV - getting QSL's on SSTV over 1000km with 50W on 40m. When I try SSB, there is no RF when I speak into the mic. The mic works on FM by the way, so I don't think there is anything wrong with it, but I'll borrow one to eliminate that possibility.

SSB works on 2m when I switch to my rotatable beam (sorry, forgot to mention this in the first post).

The G5RV will tune on all bands as expected, but only when I use FM and Digi. The only change I have made to the wire is getting it slightly higher, but the problem pre-dates that.

On 6m, I have the G5RV - yes, I know the wire is not the best option for 6m - and the vertical to choose from. Same problem with both antennas.

I've tried the dummy load both directly after the radio and after the tuner - same problem. This seems to eliminate the tuner from the equation.

By the way, the radio receives fine on all modes on all bands as far as I can tell.

The ARRl handbook should I agree be required reading. That was the first book I bought after I got my ticket in 1985, and have updated recently. Lots of useful info in there but none that solves my immediate problem with the 897.

Thanks again Guys.

Doesn't sound like any of the radios are at fault, based on the fact that nothing is working past the tuners. Would it be possible to take the tuners out of the mix, and run (at low power of course) straight into the antennas? (And you may have already tried this, so apologies if I have suggested something already attempted). Basic troubleshooting states to remove all but the basics (radio and antenna) and see what happens.

21145. my luck

Yahoo group: FT897 (2007)
Date: 2007-12-27 02:53:58 UTC
From: Lloyd M. Mitchell
Topic: 21137 Message: 21145

I would try the following connect one radio to a dummy load without a tuner in line

Connect a second radio on teh same freq to a wire near the dummy load. (fake antenna) for RECEIVE only.

See if you can hear the radio on the receiver.

Check all modes CW,SSB (usb and lsb) AM FM
Check all bands - all
Write down all results (for use later if you end up sending the unit to Yeasu)

Check and re-check every setting and if you have to do a master reset. (that is why they tell you how to do it)....

Hope you "get er' done"

Ko4Lloyd

Hi Group,
Reading this thread with interest as I have found a reasonable "work-around" for this gel cell battery voltage problem. The HF Projects group connected with the HF Pack group has a Battery Extender project available in kit or assembled version that boosts the 10.5V to 12.86 gel cell voltage input to 13 to 13.8V output. I have purchased one and will shortly try it out in the field. Am powering an SG-2020 but will be trying it next on my FT-857D. Project is the product of Virgil Stamps K5OOR (hfprojects dot com) Following is copy of my recent post to the group. Hope this info is of some value.

Hi Group,
Having just purchasing one of the HF Project's Battery Extender, I thought I might forward to the Group one of my intended uses for this neat project item. I am aware that none of this is Rocket Science, however my intent is to perhaps light a spark in someone's mind for perhaps a unique use of this neat item for themself.
One of it's uses will be as a portable power supply for one of my low power (less than 20-25 watts) rigs. Not for \PM, but more on the order of Picnic Table Portable or Park Bench Portable. (I tend to think there are more of us than are admitted on these websites). I have an over the shoulder padded nylon camera bag that was purchased and never used on another radio project. The 12v 7ah gel cell fits perfectly (on it's side) in the bottom with the Battery Extender (BE) placed on top of it. Plenty of clearance for air circulation around the BE. This will be assembled, connections made, and zipped up prior to leaving the house. It could be hours before this power package will be used. I will install a switch on the positive DC IN line to keep the fan from running in the zipped up bag as well as conserving the "standby power drain" however small. This way, upon arrival at the operating spot, I unzip the bag and flip the top open for venting, reach in and throw the switch. It's running, and ready to go. I'm really anxious to try this out in the field. I read the Project Group messages daily. I'm not sure who's idea it was to use the HF Pack Amp power supply as a free standing DC to DC power supply, but it's absolutely a money saving device for me. I can now purchase low cost 5 or 7ah gel cells for less than $20 each shipped. Compared to 5 or 10ah NiMH packs from (online discount battery site) at $65 to $150 w/smart charger + shipping (which I have purchased in the past), it's no contest. I still get my 13+ volts, plus I can get fully depleted (about 10.5v) use from my gel cells. You see, Virgil, your Battery Extender has cost me NOTHING! <G> The only downside is that I carry a bag over the other shoulder now. On a positive note however, it will probably keep me from developing a permanent lean to the left.

Topic: 21137 Message: 21148

Have you tried to put a good quality dummy load on the OUTSIDE end of your Coax cable and work your way one way or the other depending on how the SWR looks. The Radios really won't make any differance because they are all 50 Ohms out the Antenna jack, Maybe you have a good neighbor pinning your coax cable for you.

Start this test with a 50 ohm dummy load with out using ANY antenna tuners in line, be sure to check ALL the short jumpers between the Antenna Tuner and the Watt/SWR Meter your using and the dummy load as well.

Be sure to use the AM Mode on the radio you use for the test because it puts out about 20 Watts of power instead of 100 watts like FM does.

Using this procedure to test your system you should have very close to 1:1 SWR no mater where you put the Dummy load and any frequency unless you have problems with your system.
Hope this helps.

From: joel
Topic: 21113 Message: 21150

I decided to re-set the cpu, as I have a copy of the memories.

So, now I can tune the G5RV using FM/digi as we would expect - no change from before. The tuner shows effective power out to be around 80W - again no surprises here. Then I go to SSB ..... the meter registers around 10W RF even though menu 75 (RF Power set) is set to 100W.

Looks like a trip to the doctor.

21151. Monitor Modulation ?

Yahoo group: FT897 (2007)
Date: 2007-12-27 09:20:21 UTC
From: Jean RIVIERE
Topic: 21151 Message: 21151

Hi all,

I hope that Santa has been visiting everybody !

My questions are :

I have a TS-950sd and one of its function (monitor) give the ability to have a copy of BF through Audio output without any other RX or TRX.

I use it very often (not because I like my voice) but cause it's help me to give the sound I want to send (and not my children's or my wife's voice or music).

I dit not found this capability on my FT-897D (perhaps i'm wrong).
Does someone know if there is a solution to do it without RX or TRX ?
How to do to see wobulation on my Oscilloscope ?Happy end of 2007 to All with my best 73 (waiting for 2008) and

Best regards,
Jean - F5ALJ

Hi Tim,

What are you using to measure power out on SSB ? You really need to spend big bucks on a meter to give you any kind of reliable reading for an SSB signal. Your normal everyday PWR/SWR meter will not be particularly accurate when used to measure power out when using SSB. What is your Dig mode set to in the menu? I have mine set to USB for PSK use, that would indicate the the SSB side of the radio is working just fine.

From your last post it looks like almost everything is as you would normally expect it to be. How was the radio behaving before you noticed the current problem? When did it change ? What have you connected to or disconnected from the radio in recent days ? Have you changed any menu settings ?

Regards

Andrew - G7MNS

Dont despair as the other poster said take a deep breath and start from scratch...Your problem does seem like a common fault... the first to think about has got to be the Arial the second the tuner and last and most improbable is your 3 radios...
As for an Arial you dont have to send a fortune on and antenna... Try a g5rv wire..Easy to make if you fancy it or £25.00 UK£..and for a vertical try (wait for it everyone..lol) a sirio 827 cb antenna. I use one of these and it tunes all the bands with my mfj993b and works extremely well...in fact better than some dedicated ham aerials I have owned... cost £65.00 UK£

hope this helps some....dont give up

21154. Re: Polling noise under Ham Radio Deluxe

Yahoo group: FT897 (2007)
Date: 2007-12-27 14:20:58 UTC
From: Dave Matthews
Topic: 21101 Message: 21154

Hi Dani,

I'm getting a little more input on this problem gradually, and it appears that there is no real cure. The best compromise is to adjust the refresh timing of the tracking data under satellite tracker 'current data'. That reduces the polling intervals to as long as 10 seconds. That helps to reduce the obnoxious chuffing, but it also seems to delay the operation of the F1 key. (I'm still looking into that.)

So the best fix is to set the data refresh time to be something you can live with. Unfortunately at this point it is looking like the 897 and 857 will always have this annoying chuffing making real time Doppler shift correction unusable. I am still gathering information and experimenting, so I will let you know if I find the magic bullet!

From: nyjel2002
Topic: 21156 Message: 21156

Can someone post a file with different factory made interfaces like rigblaster rigexpert etc so us new guys can explore all the different options and advantages and disadvantages of each.. I think this topic needs to be addressed as alot of new hams need infomation on interface connections and where they can get them especially in light of the dicontinuity of db 9 ports on new lap tops replaced by USB ports. Also any information on home brew interfaces to USB ports would be a big help. I saw some home brew specs in files but nothing for USB ports. A permanent file would be a great source to refer to.

Thanks

Here the polling chuff-chuff noise is not noticeable on the speaker, but was very annoying on headphones plugged into the front panel jack.

My workaround was to add 10 ohm 1/4 watt resistors- one each from L and R to common (could be put right in the headphone plug). The chuff-chuff seems to be injected after the AF level control; the 10 ohm resistors form a divider with the radio's internal series 100 ohm headphone line resistors, lowering the chuff-chuff by 20 dB. It means turning up the AF level higher, but it has plenty of oomph to allow this.

Thanks Bob!

I appreciate the verification, and 'chuff-chuff' is a much better description of the sound I was trying to describe. I will look at HRD to see if I can make it poll less often. I thought I had found the setting, but it only permitted a maximum of one second, and when I selected that it didn't seem to take effect. So I probably need to look further. In order to do Doppler shift tracking of SSB satellites I imagine I need to poll/update at least twice a minute. But a much less frequent update would work very well for the FM birds, thanks for the tip.

I have tried different baud rates as you suggested, no difference noted there. Thanks again for your response and the description!

Hey Rick
I have the FT-30 tuner I purchased with my Yeasu. At first I too could not tune any antenna. Replaced the coax cable from the radio to the antenna and all was ok. I found out that the coax cable if purchased cheaply adds to big problems. Also I'd check the connectors on the cable to make sure they are ok and not grounding out.

one other thought the Yeasu has to be set in the menus to use the tuner check that incase your radio is not set to tuner.

You might want to check the CAT cable between the tuner and the FT-897.
I just bought this exact same setup about 2 weeks ago and have had a
similar problem.

Occasionally, the tuner would not work, and the radio would refuse to
transmit in any mode, any band with either the tuner or the hand mic.
The problem was also intermittent. The problem would go away when I
unplugged the CAT cable from the back of the FT-897 or bumped the radio.

It turns out, the "problem" was on the end of the CAT cable plugging
into the LDG tuner. I pressed the PTT switch and wiggled the CAT cable,
and things would come to life. I checked the solder joints on the LDG's
CAT receptacle, and it seems okay. I plugged everything back in, and it
seems to be working for now (fingers crossed). I noticed the CAT cable
does take a bit of effort to push into the tuner recepticle.

Other than that, the LDG works like everyone says... I think it might
actually be capable of loading a wet piece of string!

Rick,
I'm new here and don't yet own an 897, but reading your post I find it difficult to place the blame on 2 tuners and 3 radios. So, could you please describe your antenna - it could very well be at fault. I have an Icom 703 myself and find that the tuner in it is a very good tuner, and I have even devised a balun and random wire system to use with it that will allow me use the tuner in the 703 to get a good match on all bands. As I understandit though, the 897 doesn't have a built in auto tuner (correct me if I'm wrong), but most auto tuners that are builtinto radios are designed to tune loads that have an swr of 3:1 or under - anything over that and they usually shut down and switch to the bypass mode. Even Icom says that the tuner in the 703 is designed this way, but many folks have found out theits tuner will tune a much higher mismatch and I have even seen the one in mine tune up to a 12:1 swr in a snap. So my thoughts are, since you are having the same problem with several pieces of equipment, it must be the faultt of the antenna system. Also, checking an auto tuner with a 50 ohm dummy load doesn't always work because if the tuner detects a low swr in the first place, then it decides there is no tuning needed and will switch to bypass mode. Do you have access to an swr analyzer such as the MFJ-259B that you could check the antenna with ? Anyway, tell me about your antenna and how you have it configured as I suspect the problem is with the antenna somewhere.

Hi Dave,

The noise I am referring to is from serial port activity polling the radio on its CAT line (or whatever the serial communications port is called.) I am using the N1MM logger program, but I think any software that communicates with the radio will cause the same thing.

If users of the HRD program tap off the audio from the headphone jack (I have not checked the back speaker jack) for feeding a sound card etc, then they can virtually eliminate this noise with my suggestion.

I do not know what HRD is, so please excuse any ignorance in my reply.

21164. FT-897D master reset

Yahoo group: FT897 (2007)
Date: 2007-12-28 06:37:18 UTC
From: Adam
Topic: 21164 Message: 21164

I'm the "proud" new owner of the updated FT-897D radio. I was having an issue with the radio not transmitting on any band. I performed a master reset, and the problem did not go away. Later on, I found that the problem was between the LDG tuner, CAT cable, and radio connection. After wiggling the cable, the TX started to work normally again. I've disconnected the CAT cable, and reconnected it and everything is working fine so far.

After performing the master reset, all the memories are gone, including the 60 meter frequencies. In order to get them back, I attempted the expansion mod (internal jumpers 6,7,8,9) and reset the radio. Nothing happened.

I've heard softjump doesn't work anymore either. Any ideas?

Thanks for the clarification Chet.

HRD is Ham Radio Deluxe, and excellent CAT rig control program, and it has a satellite tracker program that allows the user to stay in Doppler sync with satellites as they pass from horizon to horizon. To do that the HRD program by default sends new frequency information to the rig twice a second. So the annoying chuff-chuff sequence is continuous while tracking a 'bird'.

This is very apparent over the speakers, but I don't mind using headphones if your solution works for this mode of the problem. I will try your suggestion very soon and tell you how it went. Thanks for the help and input!

Hello Adam - Not to sure if I am of any help -
I did the same thing on my 857D and thought
that my 60 meter frequencies were gone also
but apparently they were still there - I had a
friend (WØJGB) that came by my shack and
showed me right where they were - I wonder
if that could be what has happened to you?
I normally just used the VFO to navigate my
way around and that was fine for all else as I
primarily am just on 20/40/80 meter phone
bands from the truck. How ever if I remember
this correctly they were in the memory channels
and everything was cool (I still haven't used them)
Hope you find yours - Dave / NØATH 73

Subject: [FT897] FT-897D master reset

I'm the "proud" new owner of the updated FT-897D radio. I was having an
issue with the radio not transmitting on any band. I performed a master
reset, and the problem did not go away. Later on, I found that the
problem was between the LDG tuner, CAT cable, and radio connection.
After wiggling the cable, the TX started to work normally again. I've
disconnected the CAT cable, and reconnected it and everything is
working fine so far.

After performing the master reset, all the memories are gone, including
the 60 meter frequencies. In order to get them back, I attempted the
expansion mod (internal jumpers 6,7,8,9) and reset the radio. Nothing
happened.

I've heard softjump doesn't work anymore either. Any ideas?

Adam

I'm finally ready to actively seek an 897D,
Anyone looking to part with one ?

I'm technically capable (but time is not copious), so a 'minor repairs needed', or 'behaving funny' unit is ok by me if the price is right..

Thanks
Niel

21174. Re: [FT897] Re: CAT Control with RIGblaster plug & play

Yahoo group: FT897 (2007)
Date: 2007-12-28 21:54:32 UTC
From: Dennis Fleischer
Topic: 20850 Message: 21174

RigBlaster is a "stand-alone" piece of equipment and (as I understand) is supposed to connect to your sound card. I may be wrong. I do not have one or work those modes (yet) that require a PC/computer interface device. What you may need yo do, since most computers only have one (1) serial port, is get a PCI card that will get you one or two more serial ports and run the RigBlaster off another port. I did this using a few other devices not Ham related but found I needed the extra ports after I got tired of crawling under the desk and connecting/disconnecting different devices. Now I have three ports and the computer is happy, HRD is happy, Radio is happy, Other devices are happy, and most importantly, I am no longer crawling around and getting dirty/dusty/achy/banging my head and I AM HAPPY!

Anyway, HRD does NOT run your RigBlaster. PSK31 (or other program) is supposed to. The PSK31 program is a "separate" program that is bundled with HRD. With this in mind, try the extra ports - the card I think was like $10 bucks or so - it may solve your problem. I know that running numerous different devices off the same port can be a pain in the a** from experience.

Also, remember that HRD is designed to run your radio and that is all, which is why the cable goes from your computer directly to the back of the 897/857 without needing a PC/Computer interface. If something was needed in between, Yaesu or HRD would have told you that you would need some kind of device in between to get the system to work correctly.

Secondly, the CT-62 cable MAY NOT be wired for the RigBlaster. You may need to make/buy a cable that is wired correctly.

Hope this helps!

Thanks for all the replies guys.

Andrew, the ldg has an average power scale setting, so I was using
that to measure power out on SSB. This setting was not working
properly and I misinterpreted that as a fault with the radio.

So, the problem ended up being the tuner after all. As I previously
posted, I re-set the memories in it, and then yesterday went to set
all its parameters to the way that I work.

Lo and behold, I cant re-program it. I've ordered a new CPU, so
hopefully that will cure the problem with the tuner.

Anyway, I learned a lot from the experience and thank you all again
for your suggestions.

I recently started working some 2 meter SSB activity. It seems my FT897 is about 250 HZ low in frequency as I have to tune that low to tune in stations. Can anyone offer some thoughts as to how best to correct this?

From: n5ztw@texasdata.net
Topic: 20850 Message: 21178

I designed and build a CAT level converter and sound card interface that operates of a single serial port. The TiniCAT TC+SC-YP is "TiniCAT + Sound Card Yaesu Portable" Works with the FT-100, FT-817, FT-857, FT-897 CAT and PTT from the same serial port and other nifty features.
http://www.illumiview.com/Yaesu%20Portable.htm
I provide the schematics if you want to home brew one your self or I sell complete units or kits, partial kits, even bare PC boards. The goal is to make this solution available to all and get more hams on the digital modes.
The schematics and operations manuals are on this page.
http://illumiview.com/Support%20Documents.htm
Manuals to the left schematics to the right. The unit would be the TC+SC-YP
Again the schematics are open to the ham population to home brew if you like.
I designed it to be plug and play 1:1 from the jacks on the radio to the unit and sound card and serial port. It works FB off a single serial port.

117ft. 0 - 1/32in. or 35.662 M for 4.000, then adjust for which ever MARS frequency you talk on. If you get it close the tuner will take care of the rest.

Nigel- Can't post a file as I don't have a list. But I do have a recommendation. Check out the microHam USB Interface II from microHam AMERICA. It was recommended to me by another ham as the best interface for the FT-897D and it has performed flawlessly for over 2 years. It does not have a built in sound card, but that keeps the price down and my onboard card works FB for everything from PSK on HF to Packet on VHF. The USB II does rig control (I'm using HRD) as well as soundcard interface. And it provides great isolation. I have zero problems and don't need ferrite beads etc.

They have a great software router program that comes with the interface that lets you set up a ton of virtual serial ports and have downloadable templates for most of the popular rig control and logging programs. Makes setting up the interface a breeze.

The best thing (out of many) is the support from Joe Subich, W4TV of microHam AMERICA. I'm not a computer whiz, and Joe obviously is! And he's AVAILABLE! I emailed a question yesterday (2 years after purchase!) and had an answer in a few hours. Look up the reviews on eHam - 5.0 out of 5! http://www.eham.net/reviews/detail/5947

I'm not connected to microHam in any way - just a very satisfied customer. Check it out at http://www.microham-usa.com/

Get a g5rv...That tuner or any tuner will not tune that fat out of band...You need 2 antennas a 10 - 40 meter antenna and a 75/80 meter antenna...And it still needs to be close to resonant IF you want any signal left to radiate off of said antenna...A tuner fools the radio to where it will transmit at full power but you can tune away any signal if you ask to much from your tuner...

I am currently doing psk31 with a jump cord from the cat plug directly into the line input of computer (what the heck, just to see if it would work) and it seems to be OK. waterfall looks clean. have good results with all DSP filters on. TX interface is velcro strap holding hand mic to computer speaker. Again, seems to work OK. Rigblaster, rascal, ???? want to do psk31, and CW would like to type CW on keyboard. Someone please give me some input on this. By the way, I own 897D, 857D, and 817D and think they are all fantastic!

Slightly off topic comment......

If your only concern is keeping your SWR low, than for sure go for the FC30, AT897, etc, etc type devices that install, and coaxial connections terminate close/right next to the radio.

But keep this in mind........

Even though your load (which in the case of the "tuners" you mention), which in this case will primarily be the "tuner", makes it's best effort to match it's input impedance to the out put impedance of your transceiver for low SWR and maximum transfer of power to the load, it's likely that max power is not getting to your antenna.

If in doubt try this....

Install a SWR between the "tuner" output and your antenna. You may be quite suprised by what you read on the meter as you tune accross the various HF band you choose to operate on.

It is always best to have an antenna that is already resonant at the middle of the band you wish to operate on. If it is not truly resonant for the band you wish to operate on, than making it so (by adjusting length, inductance/capacitance/resistance as necessary to make it resonant on the band you wish to operate) is truly "tuning the antenna".

The only time I cheat is in using a wire antenna coupler which is installed directly at the antenna feedpoint. Great for random length wire radiators that I know for sure don't have the same impedance as my radio.

Maybe you already know all this, and if so, please forgive my babbling disertation.

Have fun, and 73

I have to jump in here...

I am a big fan of the bux.com Windom antenna over the G5RV or the Carolina Windom, in that one does not need the ladder line, which can present all kinds of tuning issues if the correct installation guidelines are not followed.

The bux.com version has coax running straight to the 4-1 balun. Mine is 6 to 80m and is 1:3 almost across the entire frequency spectrum with the antenna averaging 15 feet above the ground. I have talked all over the world, barefoot, phone. Cost on the antenna is quite reasonable. Prices/versions/options can be seen at www.bux.com

To each his own...but sometimes one has to explore alternatives if something isn't working or is creating issues.

Well said Terry. I would whole heartedly agree that every antenna should be as resonant as is practical. While there are times (EMCOMM, outbacking, etc) when you certainly can jus through a long wire up and use it, this should not be your main base antenna. I have tried this and it is simply too hard to everything working well. Your comments about the radio being happy with the turner is all well and good, but remember, everyone, not all the power you are putting out is getting to the antenna if you have to use a tuner to make the radio 'see' resonance. Just my thoughts.

Gary:
I'm wondering if some here have the misconception that an antenna will only radiate a certain portion of the power fed to it based on it's resonance regardless of how it's fed. That's actually not the case and non-resonant antennas can be very efficient. It's definitely more than just "fooling the radio".
The problem comes in with losses related to the tuner and feed-line, which become more dramatic as the antenna deviates farther from resonance. Those losses can be reduced by using lower loss line between the tuner and the antenna, by locating the tuner at the antenna, and by picking a tuner with lower I/R and dielectric losses (no they're not all created equal). Also, different tuners have differing abilities to achieve a solution with some being more limited (i.e. FC30) and some being more capable (i.e. FC40 and most LDG tuners). In essence, it's not a matter of needing an antenna that's close to resonance, it's having an overall solution (antenna, tuner, feed-line, etc) to achieve the desired result.

Hi Lee....

First, I have to correct myself...BUXCOMM antennas (Please note that the antennas are called BUXCOMM, no DOT) can be found at: http://www.packetradio.com/ Sorry 'bout my lapse of memory.

I have always been taught that the C.W. uses 300 ohm ladder line as a vertical radiator. In most of the antenna manuals, a Windom IS shown with ladder line.

For what it is worth, here is what RadioWorks calls a Carolina Windom:

http://www.radioworks.com/ccwcover.html

Chapter 7, page 7 of the ARRL Antenna Book, 20th Edition, also shows a vertical radiator (Ladder line) on the original Windom (From the 30's!!) and the newer Carolina Windom.

When I decided to go a wire antenna, I was put off by the need for a ladder line radiator. I have extremely high winds where I live and from experience, a twin lead/ladder line feeder will not last. Then I was loaned what eventual became a Buxcomm Windom, and my very first contact, while laying on the top stringer of a 6' good neighbor fence, was Australia! Sure made a believer out of me.

The only drawback I have found with the Windom is the power restriction......not wise to run over 1000 or so watts through it......unless one goes to a much higher rated balun!

Anywho.....Playing with wire antennas is fun....I have always enjoyed them..from the 'old days' (For me!) playing with rhombic long wires, to now, living in a restricted space housing development and having a wife who has put her foot down on my erecting towers! :((Fortunately, no CC&R's where I live, just the wife! LOL!)

21202. EU 30 Meter Digital Weekend Event 19/20 Jan 2008

Yahoo group: FT897 (2007)
Date: 2007-12-29 22:18:00 UTC
From: Don
Topic: 21202 Message: 21202

EU 30 Meter Digital Weekend Event

When: January 19th 2400 utc to January 20th 2400 utc
2 days of digital fun, ragchew and DX on 30 Meters, all
day or when you can.
(NOTE: When 30m is in decent shape please note for NA band has been
open to EU from 1900 to 2300utc for ZL/VK open to EU has been open
from 1200 to 1700 utc.appx times of course depending on band
conditions)

Where: 30 meter Band 10.135 to 10.145 MHZ

Modes: Mainly PSK31 10.140 +/- 1000
BUT all digital modes welcomed including
RTTY/MFSK/HELL/WSJT/etc.

Objective: For Amateurs Worldwide to make contact with EU Stations to
promote and increase digital mode activity on 30 Meters.

This is not a contest but a casual event in promoting 30 Meter Digital
activity in conjunction with the 30 Meter DigitalGroup:

http://www.30meterdigital.org
http://www.groups.yahoo.com/group/30meterPSKGroup

Contact: Graham m5aav m5aav@30meterdigital.org
Don kb9umt kb9umt@...

***Please note logs do not have to be sent because this event is to
promote 30m digital activity. We would appreciate though if you have
time to just give a count of stations worked and email to the above
addresses so that a report of the weekend activity can be produced.

21205. Re: [FT897] TESTING

Yahoo group: FT897 (2007)
Date: 2007-12-30 00:51:30 UTC
From: elvira@vzavenue.net
Topic: 21180 Message: 21205

Impedance of an antenna with frequency

The capacitance and inductance of an antenna are determined by the physical properties of the antenna and its environment. The major feature of the antenna is its dimensions. It is found that the larger the antenna or more strictly the antenna elements, the lower the resonant frequency. For example antennas for UHF terrestrial television have relatively small elements, whilst those for VHF broadcast sound FM have larger elements indicating a lower frequency. Antennas for short wave applications are larger still.

Bandwidth

Most antennas are operated around the resonant point. This means that there is only a limited bandwidth over which it can operate efficiently. Outside this the levels of reactance rise to levels that may be too high for satisfactory operation. Other characteristics of the antenna may also be impaired away from the centre operating frequency.

The bandwidth is particularly important where transmitters are concerned as damage may ccur to the transmitter if the antenna is operated outside its operating range and the transmitter is not adequately protected. In addition to this the signal radiated by the antenna may be less for a number of reasons.

For receiving purposes the performance of the antenna is less critical in some respects. It can be operated outside its normal bandwidth without any fear of damage to the set. Even a random length of wire will pick up signals, and it may be possible to receive several distant stations. However for the best reception it is necessary to ensure that the performance of the antenna is optimum.

Impedance bandwidth
One major feature of an antenna that does change with frequency is its impedance. This in turn can cause the amount of reflected power to increase. If the antenna is used for transmitting it may be that beyond a given level of reflected power damage may be caused to either the transmitter or the feeder, and this is quite likely to be a factor which limits the operating bandwidth of an antenna. Today most transmitters have some form of SWR protection circuit that prevents damage by reducing the output power to an acceptable level as the levels of reflected power increase. This in turn means that

the efficiency of the station is reduced outside a given bandwidth. As far as receiving is concerned the impedance changes of the antenna are not as critical as they will mean that the signal transfer from the antenna itself to the feeder is reduced and in turn the efficiency will fall. For amateur operation the frequencies below which a maximum SWR figure of 1.5:1 is produced is often taken as the acceptable bandwidth.

In order to increase the bandwidth of an antenna there are a number of measures that can be taken. One is the use of thicker conductors. Another is the actual type of antenna used. For example a folded dipole which is described fully in Chapter 3 has a wider bandwidth than a non-folded one. In fact looking at a standard television antenna it is possible to see both of these features included.

Radiation pattern
Another feature of an antenna that changes with frequency is its radiation pattern. In the case of a beam it is particularly noticeable. In particular the front to back ratio will fall off rapidly outside a given bandwidth, and so will the gain. In an antenna such as a Yagi this is caused by a reduction in the currents in the parasitic elements as the frequency of operation is moved away from resonance. For beam antennas such as the Yagi the radiation pattern bandwidth is defined as the frequency range over which the gain of the main lobe is within 1 dB of its maximum.

For many beam antennas, especially high gain ones it will be found that the impedance bandwidth is wider than the radiation pattern bandwidth, although the two parameters are inter-related in many respects.

Gary:
You make an interesting point, but I believe the limitations are related to the type of mobile antenna you may be using. Something like a single band lower-frequency HamStick will be problematic on bands far removed from it's intended frequency and particular on higher frequencies. This would be because of the higher reactance of the loading coil at higher frequencies effectively cuts off the top of the antenna. On the other hand, a straight whip or a moderately helically wound antenna will work well across a wide frequency range. Again, you want the tuner right at the antenna if you do that, which excludes mounting the tuner right to the radio unless the radio body is remoted to the antenna location.

My MFJ 993B tuner will load the radio into anything I've put up.

Are you connecting to the antenna properly? Check all feedlines
and connections.

Ya know....how do you know it is *your* 897D that is off freq?

We have a weak signal, 2 meter SSB, net every Friday night, and I have never seen (Heard??!!) so many radios that can't stay 'locked' on to each other as there are in that net.

I bring it up and it is always my radio that is off...bull puckey...I have two radios (Kenwood TS-2000 and the Yaesu FT-897D) and they are perfect to each other.....

So...Don't be so sure your radio is the culprit. Chances are, it isn't!

From: Mark Vaughan
Topic: 21177 Message: 21214

Don't forget you can also offset you internal carrier frequency, usually to change the tone of your voice. This will screw up your set frequency.

Some also shrugged a persons comment re antenna's. Whilst this is unusual the comment may have come from someones experience. Sometimes we collect our signals from other made made and moving objects, I've seen windmill blades, weather vanes and even a drum air conditioning fan on a large building cause quite large dopler shifts, obviously something also needs to be screening you from the main path. Locally a beacon was reported as being off frequency, the complainers signal came from the local wind farm, on a calm day he gets the correct reading, it was a little more compicated than this because the beacon was off, just not as much as he said, he produced a lovely chart of quite wild drifts.

Approaching weather fronts will also cause similar effects, and I'm sure some of you will think of other causes, really that's why PLL was so much a break through.

So if they say your radio is off, there are other possible causes as well as the radio, especially if the signal is weak and it's path long and unknown.

So, everybody else's radio is off frequency except yours :-)

A typical crystal oscillator, probably as used as the 'base
frequency source' in an 897, has an accuracy of perhaps 1-2kHz at
144MHz, or +/- 1 part in 10^5. The FT897D has an OCXO with about 5
parts in 10^7 accuracy or about 70Hz at 144MHz.

For people using some digital modes, and amateurs working in the
GHz bands, frequency accuracy is critical and needs to be much
better than those above.

In the UK, there are a number of beacons on 2m and above, where
the frequency is derived from a OCXO disciplined from GPS sources.

Hi Mark, you know I have a FT-817ND and only when I'm on 2 meter SSB I seem to be off frequency to other stations. I never researched it much, but just recently I was on my ic-706mkIIg talking with a friend on his new FT-857 on 144.200 USB, and guess what, we were off frequency to each other on 2 meter SSB but not on 80 or 40 meters. We were dead on, on the HF bands. If you find anything out post it, I would be interested. cheers. scott.

You might want to look at the SGC tuners that are very reliable and full featured. I have a 33' vertical (old modified butternut) that I am feeding at the base with an SGC-230 that I'm using on all bands from 160 to 6 meters. It works great and I've worked all over the world with running my FT-897 at about 10 watts output. The SGC-230 (no longer in production but they do have others) is an auto-tuner that only requires RF and 12 volts at about 500 ma input. The unit operates by sensing the RF and automatically tuning the antenna for lowest VSWR at the base of the antenna. I also use a unit on a 6 meter loop and an SGC-237 on a long wire. All perform well with the FT-897 and leave the CAT port open to interface to a computer..

SGC's are a little more expensive that some of the others but they are very reliable and top shelf quality. I can strongly recommend them as one who has been playing with antennas and tuners for a very long time.

From: Curt Givens
Topic: 21220 Message: 21222

I think you'll find with the LDG line only the FT897 uses the CAT port and it gives you a pass through to keep CAT available. The others in that line use a simple cable between tuner and aux port. I have the Z100 and it works great. I'm able to use my Carolina Windom 80 on 80 to 6. It's not in the best of locations, in a tree about 25' up with the dipole somewhat less than flat. I'm certain the tree distorts the pattern as the coax runs parallel to and about 6" away from the main trunk.

Happy New Year all,

21223. Re: [FT897] Re: Ft897 Off frequency

Yahoo group: FT897 (2007)
Date: 2007-12-30 15:38:21 UTC
From: Charles Scott
Topic: 21177 Message: 21223

Scott:
That's expected. The same reference error will result in 37 times the on-frequency error at 144 MHz as 3.9 MHz and 20 times the error as 7.2 MHz. For example, a radio with 250 Hz error on 2 Meters would likely be only 6.8 Hz off on 75 Meters. That's the difference between a noticeable error and one that's not.
Another thing to keep in mind is that people tune their receiver for SSB transmissions differently. Since there's no carrier to zero-beat, there's no specific reference when tuning. As long as you don't get too far off frequency to where the sound becomes truly unnatural, you have little indication of whether you're right on. I would think, however, that most people would get within some 100 Hz of the correct frequency--but then I've watched some tune a receiver who clearly couldn't.
I often play a game with myself when driving. I'll try to tune in an SSB signal to where I believe it's correct and then look at my display to see how close I am. This obviously is only going to work on the lower bands where there's an expectation that most stations would have minimal error and only for stations anal enough to set their dials to zero the last digit (which is quite a few these days). I often get withing 10 Hz and rarely ever more than 50 Hz (note that I've been a Ham for almost 40 years). It is, however, well more than some 6.8 Hz error.

As I wrote before, you may want to get a 2 port serial card to add to your computer. Relatively inexpensive as opposed to other alternatives to run multiple devices that need a serial port. I think mine was like 10 or 15 bucks.

edhealy13 <bipes13@...> wrote:
Hi...

I just picked up a new Ft-897 and have been trying to familiarize myself with all its functions. I plan to use a Buxcomm interface as least for starters for digital modes. I have an attic dipole for 20 and 40 meters fed from the same coax. I would like to get an antenna tuner and am leaning toward the LDG-AT-100 Pro. I also would like to use CAT software such as HRD or a similar program. My question is , how would I be able to use the antenna tuner and the CAT software since as I understand it they both use the the 8 pin CAT connector? Thanks in advance...

21225. 505KHz on FT897D?

Yahoo group: FT897 (2007)
Date: 2007-12-30 16:30:09 UTC
From: Dexter McIntyre W4DEX
Topic: 21202 Message: 21225

I have a legal need to transmit from 505 to 510 kHz and was just wondering if the 897D will put out any power at this frequency if the wide band mod is done. I have a IC735 that will put out some power there but the signal is very distorted and will not work for digital transmissions. I'm presently using the 897D on 10.105 MHz into a SRA-3 mixer with 9.6 mHz LO injection to obtain a low level signal at 505 kHz. This works but my operation would be greatly simplified if the 897D would transmit a few milliwatts in the range. I've had my 897D for close to two years now and have never had a need for the modification. I just don't want to do the mod if it will not transmit any power on 505 kHz.

W4DEX

BTW, the 897D works very well for receive way down into the LF region. I have used it to receive NDBs and LF BC from Europe as well as European ham signals on 137 kHz.

Any frequency error is 100 times more noticeable on 144 MHz than
on top band. That's why it is relatively important on HF but vital
on mictrwaves, where the frequency error is multiplied by 10,000.
It is also more important to checck it at 70cms rather than any
other band. Ask a local repeater or beacon keeper if he knows the
frequency accuracy of his repeater/beacon. Then tune for zero beat
using SSB. That will show you the error.

To make it real easy to pass the CAT access thru you might want to consider the LDG AT897 tunner. It does a very good job as a tunner, and has the benifit of having a pass thru port for CAT sigansl so you can daisy chain another device in.

I use that tunner, with HRD using a CAT-Serial connector into my laptop, and the PSK31 software (included with HRD) thru a Buxcomm Rascal GLX (RMDIN I think is the model off hand) into a USB port on the same laptop and both work great together. Both rograms with their capabilties can control the rigs various functions at the same time. This I do not have to do any wiring switches to go from SSB to DIG mode and back.

It is also possible to get the CAT signals in/out thru the RJ mic connection on the front of the rig by building yourself a splitter. I believe if you look at the file section of this forum you will find the wiring diagram for one.

Bill
I must admit to making the disparaging remark regarding the frequency change resulting from antenna polarization. I must also admit there is always the chance I am wrong. However, I am always willing to learn and would be very interested in more info on the subject. I understand frequency changes from Doppler effects but have simply never heard of a frequency shift from a simple polarization change. If I am mistaken, please accept my apology.

Hi Group,

This is normal for the multiband rigs in 6meters and up. A Lot of pepole usally just turn there rigs on and think they will be right on frequency. My findings are i turn my radio on for about 10-15 mins prior to allow the xtals and circuits to temp adjust. This is normal practice and usally elminates a lot of the problems folks are having with the new mulitband radios. 250 hz is with tolerance will a TXCO help yes but not not solve the issue with everyone being all over the place. What bandwith setting are you using. and is everyone tuning to a referance signal or just a certin operator as referance.

21232. Re: 505KHz on FT897D?

Yahoo group: FT897 (2007)
Date: 2007-12-30 19:52:08 UTC
From: Rob, WB1AEX
Topic: 21202 Message: 21232

My 897D is software modified for wideband transmit. It will transmit as low as 1.800 Mhz. As soon as I tune it below 1.800 Mhz it will display the TX ERROR message if transmission is attempted. It will put out power from 1.8 mhz - 56 mhz continuous, but will not go outside those boundaries in the HF-VHF-Low ranges.

As you mentioned, the receiver is quite good in the VLF range for beacon hunting and other VLF fun!

STILL HAVING PROBLEMS WITH ANTENNAS AND THANKS FOR ALL THE RESPONCES
just thought my antenna is cut for four meg the 897 and tunner works fb
on 80 mtrs but not on 40,20 and 6 mters does any know of a good size
and type of antenna to use the 4 meg is there for my mars ops [snip]

Well, if its like most autotuners that are in the shack with the radio,
it is designed for not mucch more than a 3:1 swr at best. You might want
to check out the unun I use along with a random wire with my Icom 703's
autotuner to get all band operation. Using the unun and a 23' wire gives
10 thru 40 meter operation, a 50' wire gives 10 thru 80 meter coverage,
and a 100' wire gives 10 thru 160 meter operation and I'm sure any one of
these would also give 6 meter operation, but I have the early 703 without
6 meters. Info about the unun can be found on my website at:
www.angelfire.com/electronic2/qrp/unun.html

We have a weak signal, 2 meter SSB, net every Friday night, and I have never

seen (Heard??!!) so many radios that can't stay 'locked' on to each other [snip]

I think thats due to the fact that far too many folks depend on what their display says and don't know how to zerobeat each other anymore. I hear folks all the time being told they are off frequency and they will say "my display says I'm right on", so I ask them if my voice sounds natural. Most of the time they will say something like you are too high pitched or you got too much bass, so I tell them to tune to where I sound natural. Then they will tell me I sound good to them, but now their display reads off frequency. Use the display to get close, then zero beat to the other stations so you can understand each other - don't worry about what the display says - thats how they did it in the old days ! And 250 hz isn't much on 2 meters either ! Also, make sure the RIT or clarifier is off when tuning in to make sure everyone is on the same frequency.

I'm not sure about the 897, but the 857, which doesn't have a tcxo, yaesu fitted the xtal right behind the rear vent. When you tx and the fan starts it draws air right across the Xtal.

Even with a tcxo in the 897's I would have thought this would cause some drift, you wouldn't normally expect drift on a tcxo from air draft, but, if you look at the spec the Tcxo Yaesu use isn't really very good, barely what you would expect from a tcxo, so it's heater and stat is probably borderline of being able to do it's job.

In the lab/shack my frequency reference and counter all ise a hi tolerance OCXO gps linked for final error correction though it never seems to need any. Every time I've pulled the 857 out of the car for a maintenance check, the frequency has been way off, it won't even adjust to frequency now so that radio get's left to FM and HF use where the accuracy isn't that critical. I have a Kunhe Xtal heater kit I'll get around to fitting one day, but I do wonder if a shield around the Xtal might help stability when the fan pulls air across it, might also help you 897 tcxo owners.

Gary:
You make an interesting point, but I believe the limitations are related to the type of mobile antenna you may be using. Something like a single band lower-frequency HamStick will be problematic on bands far removed from it's intended frequency and particular on higher frequencies. This would be because of the higher reactance of the loading coil at higher frequencies effectively cuts off the top of the antenna. On the other hand, a straight whip or a moderately helically wound antenna will work well across a wide frequency range. Again, you want the tuner right at the antenna if you do that, which excludes mounting the tuner right to the radio unless the radio body is remoted to the antenna location.

Subject: [FT897] Re: strange tx error

Thanks Curt

Yes, I understand what you are saying. However, when I key the mic and talk into it, no RF is registering either on the FT-meter or the meter on the tuner. It's as though the SWR is so high that the protection circuits are cutting in, but on FM at the same frequency, the rig is operating correctly. and both the FT-meter and the tuner show similar SWR and RF power readings.

By the way the SWR meter on the tuner is'nt working either except on FM when I talk into the mic.

Thanks again

Tim R

21242. Buying FT897D

Yahoo group: FT897 (2007)
Date: 2007-12-28 20:37:05 UTC
From: John Murphy
Topic: 21242 Message: 21242

I am looking over the next few months of purchasing this rig, plus additional accessories as needed. What do I need to consider in buying this rig? Power supply? Battery pack? Tuner? Etc?

I will be using this mostly as a base, however, I like the portability for field day, weather, emergencies, etc. I am the ARES EC for my county so this will also serve as a portable/emergency kit radio.

Thanks for any help, info, etc

Sounds like a great device, but my guess is that it most likely costs MUCH more than a 2 port PCI card. I most likely could buy a case of those PCI cards for what you ask for one of your devices. Am I right? Not every one in this hobby wants to spend hundreds of dollars to get their systems working. At the least, he could concievably run other non-ham devices without the need to connect/disconnect something to the port. Will your device run non-ham items that should need to be connected to a serial port? My guess would be no, but I could be wrong. I would still recommend the PCI card anyway, it's easier and most likely MUCH cheaper.

I designed and build a CAT level converter and sound card
interface that operates of a single serial port. The TiniCAT
TC+SC-YP is "TiniCAT + Sound Card Yaesu Portable" Works with
the FT-100, FT-817, FT-857, FT-897 CAT and PTT from the same
serial port and other nifty features.
http://www.illumiview.com/Yaesu%20Portable.htm
I provide the schematics if you want to home brew one your
self or I sell complete units or kits, partial kits, even
bare PC boards. The goal is to make this solution available
to all and get more hams on the digital modes.
The schematics and operations manuals are on this page.
http://illumiview.com/Support%20Documents.htm
Manuals to the left schematics to the right. The unit would
be the TC+SC-YP
Again the schematics are open to the ham population to home
brew if you like.
I designed it to be plug and play 1:1 from the jacks on the
radio to the unit and sound card and serial port. It works
FB off a single serial port.

21244. WSJT & Ft897D question

Yahoo group: FT897 (2007)
Date: 2007-12-31 13:18:04 UTC
From: Fred Siegmund
Topic: 21244 Message: 21244

In the manual it says to use a shift of +1500Hz during JT65 (WSJT) use.
I dont see a point
to do that. Or is there a reason? Use USER-U and DIG SHIFT and DIG DSP =
0 seems
to be the right way if you want to read out the correct qrg. Or am i wrong?
